

17th April 1967.

Dr Paul Doty,
Department of Chemistry,
Harvard University,
12 Oxford Street,
Cambridge 38, Massachusetts,
U.S.A.

Dear Paul,

I enclose a copy of the valine sRNA sequence, together with some notes that you left behind. The most obvious suggestion that was made here was that the effect of GTP might be due to release of sRNA that was cluttering up the peptide site. To check this Thach should pre-incubate the ribosomes with GTP, then remove as much GTP as possible, and repeat his experiment in the presence of the inhibitor. If the above suggestion is correct the GTP should only be needed in the pre-incubation stage and not in the incubation proper to get the usual effect. Your notes which you wrote on the board have fortunately not been rubbed out and read as follows:-

Effect on freezing of phasing
20° or 30°
10 x sRNA
two step release
degradation of F met val phe

I am not quite sure what all these mean but I expect they will remind you of something.

Don't forget you were going to send me a copy of that review explaining how women are too fond of sex, and are restrained by the conventions of society.

I also enclose my latest blast against Jim. Bragg is beginning to wobble and I think now is the time for you and John Edsall to take

Dr Paul Doty.

17th April 1967.

a new look at the whole problem.

It was nice seeing you. Do come again any time you feel like it.

F.H.C. Crick.

Encs.
