The Survey Staff

EMIL FRANKEL, Director

(Director, Division of Statistics and Research, New Jersey State Department of Institutions and Agencies)

WILLIAM H. MACDONALD, Associate Director

(Chief, Bureau of Local Health Administration, New Jersey State Department of Health)

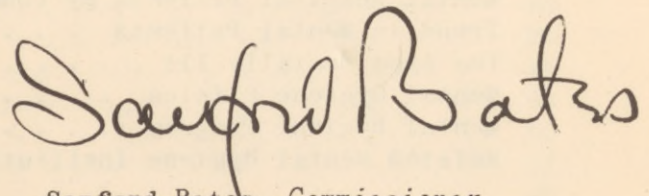

FOREWORD

Under the Federal Hospital Survey and Construction Act (*Public Law 725*) passed by Congress in the fall of 1946, the New Jersey State Department of Institutions and Agencies was designated by the Governor and the Legislature as the "single state agency" to administer the Federal program in New Jersey.

A prerequisite to the distribution of Federal funds in New Jersey is the development of a State plan to show the overall requirements for additional hospitals and public health center facilities throughout the State. This plan is now being evolved by the Department of Institutions and Agencies with the cooperation of the Hospital Advisory Council.

To date a great deal of basic statistical material has been gathered on the basis of a survey originally sponsored by the New Jersey State Commission on Post-War Economic Welfare which utilized the research facilities of the New Jersey State Department of Institutions and Agencies and the New Jersey State Department of Health. It is the purpose to present this material here as a SOURCE BOOK preliminary to the issuance of the State Plan.

Appreciation is expressed to the New Jersey Commission on Post-War Economic Welfare and the several hospital, health and medical organizations for their part in the preliminary survey; and to Emil Frankel, Director, and William H. MacDonald, Associate Director of the Survey for having taken on voluntarily this added responsibility.

Sanford Bates, *Commissioner*
New Jersey State Department of Institutions
and Agencies

I. THE FEDERAL HOSPITAL SURVEY AND CONSTRUCTION PROGRAM IN BRIEF

The Federal Hospital Survey and Construction Act defines "adequate facilities" as follows:

1. Tuberculosis hospitals -- $2\frac{1}{2}$ beds per average annual death from tuberculosis
2. Mental hospitals -- 5 beds per 1,000 population
3. Chronic disease hospitals -- 2 beds per 1,000 population
4. Public health centers -- 1 per 30,000 population
5. General hospitals -- $4\frac{1}{2}$ beds per 1,000 population

Within the State, general hospitals are to be planned on an area basis, setting a pattern for a coordinated hospital system. The *base area*, with a large hospital -- if possible, associated with a medical school -- serves several *intermediate areas* having smaller general hospitals. Each of these in turn serves neighboring *rural areas* with more limited facilities. The ratio of beds to population is graded so that there are proportionately more beds in the larger medical centers where more complete service is available.

On the basis of these criteria for the consideration of "adequate facilities" the following facilities would be required for the State of New Jersey:

1. General hospitals -- 18,720 beds
2. Tuberculosis sanatoria -- 4,640 beds
3. Mental hospitals -- 20,800 beds
4. Chronic disease hospitals -- 8,320 beds
5. Public health centers -- 135 health centers

III. GENERAL HOSPITALS

BEDS BY COUNTIES AND COMMUNITIES

In 1946 there was available a capacity of 14,837 beds for adults and children in New Jersey's 87 voluntary and governmental general hospitals*, which is equivalent to a ratio of 3.57 available beds per 1,000 general population. This prevailing ratio might be set against the general ratio of 4.5 beds per 1,000 general population as the maximum ratio for which matching funds may be obtained under the Federal Hospital Survey and Construction Act (Public Law 725).

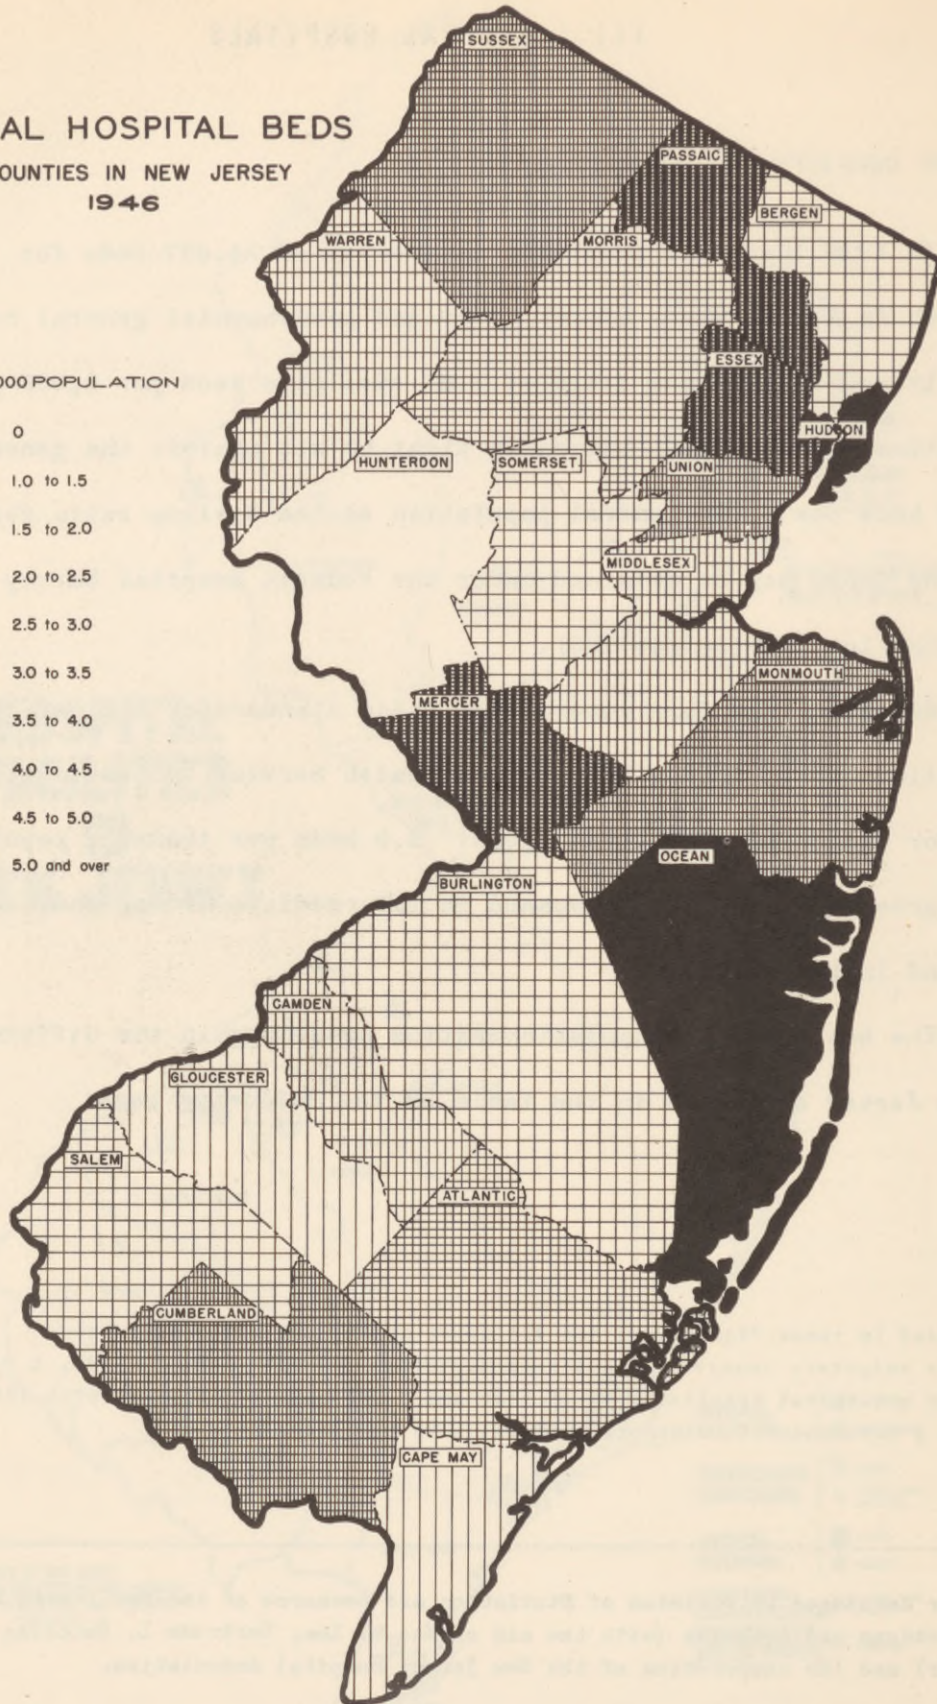

Supplementing this general bed ratio standard of 4.5 per 1,000 general population the following U.S. Public Health Service bed ratio standards obtain for different population areas: 2.5 beds per thousand population in rural areas, 4.0 beds per thousand in intermediate areas, and 4.5 beds per thousand in base areas.

The hospital bed population ratios obtaining in the different counties of New Jersey are shown in the table on the following page:

* Included in these figures are the following allied special hospitals:
Five voluntary non-profit hospitals (1 babies hospital with 70 beds, 1 eye, ear, nose and throat hospital with 65 beds and 3 orthopedic hospitals with 196 beds) and 1 governmental maternity hospital with 345 beds.

(a) Adult and children beds, excluding bassinets.

(b) Includes ultimate bed capacity of Jersey City Medical Center (1800). Service figures throughout the report, however, are based upon the present bed complement of 1450.

Among the 87 general hospitals 83 are voluntary, non-profit hospitals, one is county-owned (*Margaret Hague Maternity, Hudson County*) and three are city owned (*Newark, Jersey City and Irvington Hospitals*).

While a considerable proportion of the 87 general hospitals are comparatively small in size (*43.7 per cent are less than 100 beds*) the bulk of the beds as well as the services rendered are in the hospitals of 100 beds and over: 85.4 per cent of the total beds, 84.2 per cent of the total admissions and 87 per cent of all the patient days rendered.

COUNTY FACILITIES AND IN-PATIENT ADMISSIONS

Of the total of 360,271 admissions which occurred in the 87 voluntary and governmental general hospitals in New Jersey in 1946, 73.4 per cent occurred in the hospitals of six counties: Essex 25.5 per cent; Hudson 17.5 per cent; Passaic 10.4 per cent; Union 7.6 per cent; Mercer 6.5 per cent; and Bergen 5.9 per cent.

IN-PATIENT SERVICES

During the last decade or so New Jersey general hospitals have seen a continuous upward swing in the utilization of their services. The admission of in-patients (*exclusive of maternity cases*) which numbered 188,070 in 1930 have increased to 232,575 in 1940 and jumped to 278,645 in 1946. There has been a corresponding increase in the patient days rendered, of course, although the average length of stay has been perceptibly shortened.

Accounting for this shortened hospital stay are both the results of the advances made by medical science which have accelerated recovery and shortened the convalescence period of the individual patient, as well as the necessity of making beds available for patients so that a relatively larger number may be cared for with the reduced medical and nursing personnel.

IN-PATIENT SERVICES IN GENERAL HOSPITALS IN NEW JERSEY

Adults and Children Only - Excluding Maternity Services (Mothers & New-Born)

1930 - 1946

Year	Admissions	Patient days	Average days' stay
1930	188,070	2,432,990	12.9
1931	193,375	2,568,275	13.3

AVERAGE LENGTH OF HOSPITAL STAY

It is to be noted that in the figure which expresses the "average length of stay" of all patients are included average stays of varying lengths dependent upon the different types of patients and of services received viz., patients include adults, children and obstetrics, and within each of these are medical, surgical, eye, ear, nose and throat, and other specialized services.

AVERAGE LENGTH OF STAY (DAYS) BY TYPE OF SERVICE RENDERED

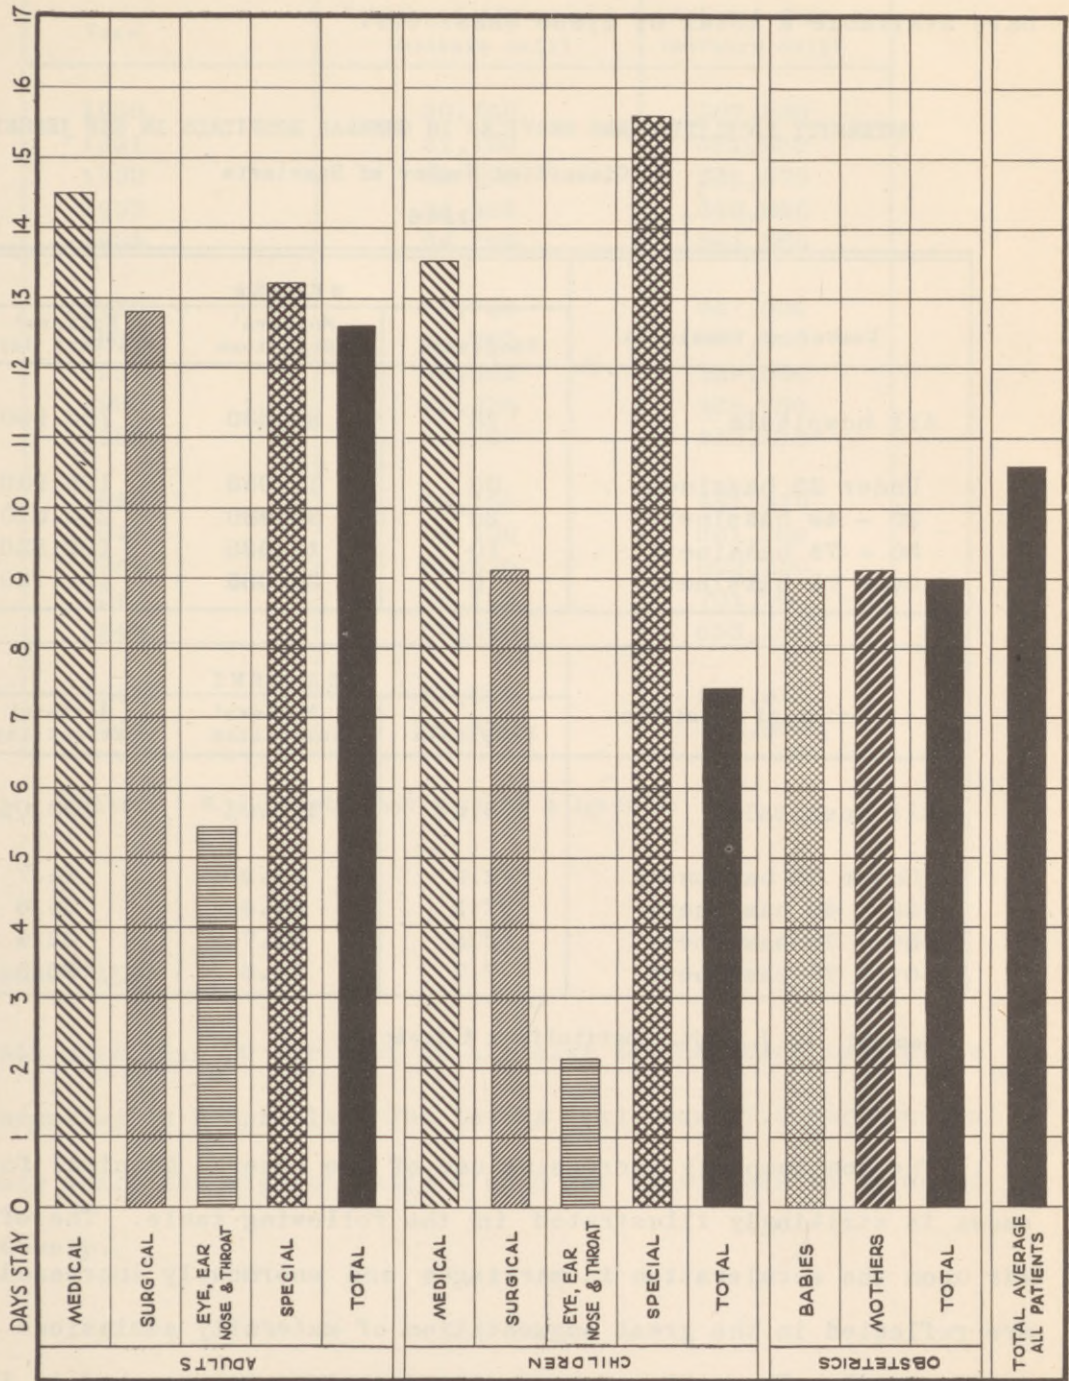

(26 Voluntary General Hospitals)

1945

Over 75 bassinets	7.7	24.6	26.3

Source: N. J. Dept. Institutions & Agencies

The continuously increasing use of the general hospital for maternity cases is strikingly illustrated in the following table. The effects of the war upon the acceleration in marriages and enormously increased birth rate are reflected in the great augmentation of maternity admissions in the years 1941 to 1943. The peak in maternity admissions was reached in 1946 with such admissions numbering 81,630.

BIRTHS IN HOSPITALS

In 1941 more than 90 per cent of all live births which took place that year occurred in hospitals. The lowest ratio was 77.5 per cent in Sussex County while the highest ratio - 97.5 per cent - was to be noted in Bergen County.

LIVE BIRTHS BY PERSON IN ATTENDANCE IN NEW JERSEY

EMERGENCY MATERNITY AND INFANT CARE PROGRAM

During the war period a most significant development has been the Emergency Maternity and Infant Care program which was put into effect in April, 1943 to give assistance from Federal funds to the families of enlisted men in the armed services. The plan provided for the complete cost of physicians' and hospitals' maternity services and for the treatment for illness of infants up to one year of age, both according to fixed scales of charges.

The program in New Jersey was administered by the Bureau of Maternal and Child Health of the State Health Department and the numbers of mothers and babies involved are summarized in the following table. The plan was still in effect (June, 1947) but is operating at a greatly reduced rate.

After each birth occurred the family was referred to the Public Health Nursing organization in the community of residence and a large amount of follow-up service was thus rendered of which there is no state-wide record.

OPERATIONS OF E.M.I.C. PROGRAM IN NEW JERSEY

Period	Mothers	Infants	Total Cost
May 1 - June 30, 1943	5,335	190	\$1,181.95

OCCUPANCY RATES

The occupancy rates in the general hospitals in New Jersey in recent years have been quite high and have been at a point beyond which they should not go in order to insure adequate care to the individual patient.

Administrative experience in general hospitals has demonstrated that efficient and adequate provision for community requirements cannot be carried on with an average annual bed occupancy of more than 75 per cent to 80 per cent. This is in large part due to the fact that the general hospital must provide segregated departments for various age and therapeutic classifications, i.e., separate wards for men and women, for surgical, medical, obstetric and pediatric cases and for isolation of communicable and infectious conditions, and patients in disturbed or critical condition.

There is also the obvious necessity of providing for the peak loads which occur at unpredictable periods during the year. The vast difference in minimum load and peak load is aggravated by the previously mentioned

segregation requirements. For example, a general hospital may, even at a time when its total occupancy is considerably below its total capacity, be very much over-crowded in certain of its departments with patients who cannot properly be cared for in other locations.

OCCUPANCY RATES OF GENERAL HOSPITALS IN NEW JERSEY
1929 - 1946

Year	Total	General (Excluding mothers and new born)	Maternity (Excluding new born)
1929	68.6%	73.4%	41.4%
1930	67.3	70.4	49.9
1931	68.3	74.3	40.9
1932	66.2	71.7	41.9
1933	64.9	69.5	44.3
1934	67.3	72.8	42.6

TREND IN USE OF DIFFERENT HOSPITAL ACCOMMODATIONS

The very favorable economic situation engendered by the war period which expressed itself in correspondingly higher incomes for the great mass of the people, and the increasing number of Blue Cross subscribers is reflected in the growing proportion of patients able to avail themselves of the higher-priced general hospital accommodations.

TREND IN IN-PATIENT SERVICES IN VOLUNTARY GENERAL HOSPITALS BY TYPE OF ACCOMMODATION (EXCLUDING NEWBORN) 1940 - 1946

Source: N. J. Dept. Institutions & Agencies

In 1940, 34.3 per cent of the admissions were to semi-private rooms as against 51.3 per cent in 1946. Likewise ward-private patient admissions increased from 16 per cent in 1940 to 19.9 per cent in 1946. The notable fact is the decrease in ward-general admissions (37.2 per cent in 1940 to 16.3 per cent in 1946) the bulk of whom constitute the so-called "charity" patients who are largely the responsibility of the public welfare bodies.

OUT-PATIENT VISITS

It has long been the practice for the New Jersey general hospitals to utilize the out-patient clinics as an effective device to meet the needs of the sick poor who are able to come to some fixed point. Through the cooperation and generosity of the medical professions the clinics have been able to bring together well-equipped specialists representing the different branches of medicine utilizing to the fullest the available diagnostic and therapeutic facilities.

1944	926,669
1945	837,417
1946	925,873

Source: N. J. Dept. Institutions & Agencies

There is to be noted a sharp increase in out-patient visits to general hospitals beginning with the depression in 1929. As the employment situation improved there is a noticeable drop in out-patient visits, which shoot up again with the onset of the "secondary" depression in 1936.

From 1940 to 1945 there is a continuous drop in out-patient visits reflecting, no doubt, the improved economic situation of the average wage-earner and his desire to seek medical advice through the private practitioner and pay for such services.

In the one year period 1945-1946, which marks the ending of World War II and a complete alteration in the employment situation, the number of out-patient visits to general hospitals is again on the increase.

HOSPITAL EXPENDITURES AND COSTS

The current operating expenditures of the 87 general hospitals amounted to more than forty million dollars in 1946, with receipts from patients estimated at thirty million dollars, thus presenting an operating deficit of some ten million dollars.

The sharp increase in the cost of living in the last few years is reflected in an increase of the current operating expenditures of \$2,932,895 between 1943 and 1944; \$3,732,640 between 1944 and 1945; and \$7,277,830 between 1945 and 1946.

TOTAL GENERAL HOSPITAL EXPENSES IN NEW JERSEY

1930 - 1946

Year	Total annual expenditure
1930	\$15,909,370

Regarding the problem of meeting the mounting hospital deficits and the problem of securing adequate reimbursement by the hospitals for the care of the indigent patient, the following comments quoted from a study* made recently

* "Hospital Care of the Indigent and Medically Indigent in New Jersey" A Review of the Policies and Legal Resources for Adequate Hospital Care.

ESTIMATED ANNUAL HOSPITAL RECEIPTS AND EXPENDITURES (VOLUNTARY AND GOVERNMENTAL HOSPITALS)*

1929 - 1946

Source: N.J. Dept. Institutions + Agencies

* General Hospitals only

by the New Jersey Hospital Association and the New Jersey Department of Institutions and Agencies, will be of interest:

"Even before the depression there was a strong feeling that government, particularly local government, held the basic responsibility for financing the care of the indigent sick in hospitals. While subscribing to this point of view as a principle, however, most hospitals found it satisfactory in practice to combine revenues received from contributions, endowments and from service to patients able to pay full hospital charges, with occasional governmental subventions in financing charitable services. This remains true today, although the proportion of total income from the several sources has changed.

"With the depression, however, the trend toward governmental support of the indigent sick was considerably accelerated. The number of patients unable to meet the cost of hospital care greatly increased, the revenues available from endowment diminished sharply because of the deterioration of investments and the reduction of interest rates. Philanthropic giving decreased. Only through governmental payments could the hospitals continue to furnish the service upon which communities had come increasingly to depend as a central feature of the total health and welfare program."

AVERAGE DAILY PER CAPITA COST

The average daily per capita cost of patients in voluntary general hospitals has doubled between 1940 and 1947. It has been remarked by hospital administrators that in spite of these mounting per capita costs the total cost of a hospital stay has not materially increased to the individual paying patient in recent years as there has been a reduction in the average stay of the patient in the hospital.

AVERAGE DAILY PER CAPITA COST
Voluntary General Hospitals in New Jersey

1940 - 1947

Year	Based on adult hospital days only	Based on adult hospital days, plus 1/4 infant days

ANNUAL HOSPITALIZATION EXPENSE OF THE GENERAL POPULATION

Taking the total general hospital expenditures which were estimated at \$40,566,275 in 1946, the calculation may be made that the average expenditure for general hospital purposes amounted to \$9.75 per New Jersey inhabitant that year. These figures could be used to gauge the extent to which the people of given counties may be able to support and maintain local hospital facilities.

ANNUAL HOSPITALIZATION EXPENSES IN GENERAL HOSPITALS
OF THE NEW JERSEY POPULATION

By Counties

1946

County	Estimated annual hospital expense for total county population
All counties	\$40,566,275
Essex	8,165,005
Hudson	6,358,120
Bergen	3,994,510
Union	3,201,720

Cape May	281,995

Source: N. J. Dept. Institutions & Agencies

It might be noted parenthetically that taking the adult bed capacity of the hospital as a whole it cost \$2800.18 to maintain an adult hospital bed in 1946; and it cost \$3711.46 to maintain an occupied hospital bed. It cost \$112.60 per hospital adult admission during 1946, and \$91.80 if all patient admissions including new-born are considered.

HOSPITAL SERVICE PLAN OF NEW JERSEY (Blue Cross)

The Hospital Service Plan of New Jersey, the first of the Blue Cross Plans as they are known today, was organized in 1932 through the cooperative movement of the hospitals. Today, there are 200 member hospitals.

The New Jersey Plan was also the first to provide inclusive family enrollment at a flat family subscription rate.

The Plan is 100% non-profit and is approved by the New Jersey Hospital Association and the Medical Society of New Jersey. It is the only plan in the State approved by the American Hospital Association. It is under the supervision of the Department of Banking and Insurance and the Department of Institutions and Agencies for the State of New Jersey.

The Plan provides hospital protection for its members and their families. The Plan agrees to pay for hospital bills up to a total of 21 days' hospitalization for the following hospital services rendered in semi-private or ward accommodations:

1. Bed and board
2. General nursing service
3. Routine laboratory examinations
4. X-rays connected and consistent with actual treatment
5. Routine medications, dressings, and plaster casts normally supplied by the hospital
6. Use of the operating room
7. Use of the delivery room in cases eligible for maternity services
8. Anesthetics if supplied by the particular hospital and administered by salaried employee of hospital

If the subscriber selects a private accommodation in a cooperating hospital, or any accommodation in any other general hospital, the Plan payment serves as a credit toward the total hospital bill for these services; and any balance of the bill is chargeable to the patient.

After the first 21 days of benefits, the Plan allows up to \$3.00 per day toward the hospital bill up to 90 additional days.

In the event that an eligible person requires hospital emergency services through accidental injury which does not result in admission as a hospital bed patient, the Plan will reimburse the person up to \$8.00 for hospital services received for each such injury.

Since its organization to the end of March, 1947, Blue Cross payments for hospitalization totalled \$23,801,191 for 358,623 persons hospitalized.

HOSPITALIZATION EXPERIENCE UNDER HOSPITAL SERVICE PLAN
OF NEW JERSEY (Blue Cross)
1933 - 1946

Year	Persons enrolled	Total cases hospitalized	Payments to hospitals
1933	2,798	123	\$5,764

A summary of the operation of the Hospital Plan of New Jersey for 1946 is given below:

NON-MATERNITY AND MATERNITY CASES HOSPITALIZED UNDER
HOSPITAL SERVICE PLAN OF NEW JERSEY (Blue Cross)
1946

Service	Total cases hospitalized	Patient days	Paid to hospitals
Non-maternity	60,391	585,401	\$3,913,910.08
Maternity	14,945	136,455	1,186,304.99
Total	75,336	721,856	\$5,100,215.07

Source: Hospital Service Plan of New Jersey

Of the 75,336 cases hospitalized 19.8 per cent were maternity patients, who were served 18.9 per cent of the total hospital days. The average payment to the hospital per non-maternity case was \$64.81 and per maternity case \$79.38. The per diem payments for each non-maternity case amounted to \$6.69 and per diem payments for maternity cases were \$8.69.

A study of the relative proportion of "Blue Cross" patients to the total patient load obtaining in 16 general voluntary hospitals in one year showed 22.2 per cent of total admissions were Blue Cross cases and had been served 19.1 per cent of all the patient days. The range in admissions was from 6.4 per cent to 39.0 per cent, and in-patient days from 5.8 per cent to 34.6 per cent.

The significant place of the Blue Cross patient in the operation of the voluntary general hospital is further graphically illustrated on the basis of a special study made in one of the large voluntary general hospitals in Essex County.

Type of accommodation	Per cent of Blue Cross patients to total	
	Number of patients	Number of patient days
Total	35.8%	30.1%
Private	44.6	42.7
Semi-private	47.2	40.7
Ward-Private	11.1	11.7
Ward-General	7.4	7.2

MEDICAL-SURGICAL PLAN OF NEW JERSEY

The Medical-Surgical Plan of New Jersey is a non-profit corporation organized by the Medical Society of New Jersey supplementing the activities of the Hospital Service Plan of New Jersey.

Subscribers of the Hospital Service Plan with under-average income may also subscribe to the Medical-Surgical Plan and be eligible to medical, surgical, maternity, anesthesia, and consulting services rendered to them while bed patients in hospitals by fully licensed physicians.

In addition, the Plan has found it possible to pay benefits under the following conditions: 1. Tonsillectomies performed in physician's office; 2. Maternity services rendered anywhere at time of full term delivery; 3. Emergency surgical services rendered in the out-patient departments of hospitals without admission for bed occupancy; 4. Emergency surgical services occasioned by accidental injury rendered anywhere within 24 hours after the accident, if in the Plan's opinion such treatment should ordinarily require hospital bed occupancy, for which the Plan will pay in accordance with its schedule of benefits, but not to exceed \$25.00 in connection with any one accident.

All matters pertaining to enrollment, billing, collections and general accounting are serviced through the facilities of Hospital Service Plan of New Jersey (Blue Cross). All matters respecting physician and patient relationship, standards of medical care, determination of eligibility of claims, and claim payments are handled through a separate office maintained by Medical-Surgical Plan.

The first contract for enrollment of employees and their dependents was issued on July 1, 1942. The enrollment as of April 30, 1947 was 104,840 persons.

During the month of April, 1947, the earned subscription of the Plan amounted to \$70,700.17 and the claims incurred in that month in accordance with its schedule of benefits totalled \$55,946.50. The earned reserve of the Plan as of April 30, 1947 was \$199,581.35.

TECHNICAL PERSONNEL IN ALL HOSPITALS

On the basis of reports furnished to the American Medical Association New Jersey had 1443 full-time and 180 part-time technical personnel employed in all of its hospitals.

Included in the above facilities are approximately 430 beds for children with an average census of 298 and 654 admissions.

In addition to these facilities there are approximately 1050 beds set aside in mental hospitals for the accommodation of tuberculosis patients.

PUBLIC TUBERCULOSIS SANATORIA AND CLINICS IN NEW JERSEY 1946

⊕ SANATORIA
+ Municipalities having
Clinics.

TREND IN SANATORIA UTILIZATION

The trend in the utilization of public tuberculosis sanatoria during the period 1930-1946 is shown in the following table:*

Year	Average number of adult patients	Number of adult admissions during year
1930	1768	3006
1935	2123	2792
1940	2724	2997
1941	2745	3066
1942	2739	3196
1943	2646	3113
1944	2367	2896
1945	2240	2638
1946	2167	2883

Source: N. J. Dept. Institutions & Agencies

*Excluding Newark City Hospital (Tuberculosis Ward) used primarily as receiving unit for transfer of patients to the Essex County Sanatorium

It appears that during the war period there was a considerable decline in tuberculosis sanatoria admissions and a resultant reduction in the patient load. Sanatorium administrators agree that this decline was largely due to the unusual employment opportunities available during the war years which kept some patients from entering sanatoria and caused other patients to leave even against the advice of the physician.

It will be noted that since the ending of the war the admissions to tuberculosis sanatoria are again on the increase.

TUBERCULOSIS PATIENTS BY COUNTIES

Around 2250 adult patients were maintained in 18 of the 20* tuberculosis sanatoria (*public and private*) on June 30, 1946, shown by county of residence in the following table:

COUNTY OF RESIDENCE OF ADULT PATIENTS
IN TUBERCULOSIS SANATORIA IN NEW JERSEY

*The two sanatoria not included are: the ward at Newark City General Hospital, at which patients stay short periods while awaiting transfer to the Essex County Sanatoria, and Deborah Sanatorium which takes primarily out-of-state patients.

TUBERCULOSIS CLINICS*

Some 36 clinic services report monthly to the New Jersey Tuberculosis League. They operate under auspices of sanatoria, boards of health, county tuberculosis leagues and general hospitals. The 88 centers are located in 6 sanatoria, 33 general hospitals, 13 municipal buildings, 2 tuberculosis association offices, and various other health centers.

Equipment is available in sanatoria and general hospitals for the services required for modern diagnostic treatment. Clinicians, nurses, and clerical workers are supplied by sanatoria, health department, county freeholders, Red Cross, and tuberculosis associations. Private practitioners sometimes contribute services as clinicians, while Glen Gardner extension clinicians supply a large share of the medical service for rural communities.

In 1945, clinic sessions numbered 6,144 extending over a period of 11,114 clinic hours. The sessions were attended by 28,152 patients of whom 14,920 were new cases. Of the new patients, 1,469 were diagnosed as reinfection pulmonary tuberculosis. There were 21,783 patients on the active clinic register December 31, 1945.

The Portable X-ray unit is increasingly employed in mass screening operations conducted in schools, factories, housing projects, migrant camps, and community centers. Three units are now in operation under State Health Department auspices. County tuberculosis associations own equipment in Camden, Somerset, Middlesex, and Union Counties.

Draftees have had the benefit of X-ray examination since the beginning of selective service in New Jersey and 6,112 persons have been referred for follow-up service.

TUBERCULOSIS DEATHS BY COUNTIES

In the five-year period 1941-1945 the number of deaths from tuberculosis in New Jersey averaged 1836 and represented a death rate of 45 per 100,000 of the total general population. As the following table shows there are considerable variations in the tuberculosis death rate among the several counties.

*From "Tuberculosis Control in New Jersey - 1945" New Jersey Tuberculosis League, Inc., 1946.

TUBERCULOSIS DEATHS BY COUNTIES IN NEW JERSEY

TUBERCULOSIS CASE AND DEATH RATES IN NEW JERSEY

..... Cases Reported (all forms) Per 100,000 general population
 — Deaths (pulmonary only) Per 100,000 general population

TREND IN TUBERCULOSIS CASE AND DEATH RATES

One of the most encouraging features in the anti-tuberculosis campaign in New Jersey and elsewhere is the constantly declining number of tuberculosis cases and deaths occurring in the general population. The following figures depict this graphically for the state as a whole.

Year	Rate per 100,000 general population	
	Tuberculosis cases reported	Tuberculosis deaths
1920	191.86	114.8
1930	130.59	69.4
1940	88.92	43.8
1941	85.55	44.5
1942	93.03	43.9
1943	94.52	46.8
1944	83.37	44.1
1945	81.24	41.1

V. MENTAL HOSPITALS

FACILITIES AND SERVICES

A summary of the presently available bed facilities for patients in mental hospitals, and figures on the hospital population and admissions are presented below:

MENTAL HOSPITAL FACILITIES IN NEW JERSEY

1946

Mental hospitals	Rated normal bed capacity	Average census	Total admissions
Total	13,782	17,758	5,599
State	8,877	11,549	3,466
Greystone Park	4,237	5,685	1,604
Trenton	2,852	3,099	967
<i>(Criminal Unit included above)</i>		<i>(236)</i>	<i>(102)</i>
Marlboro	1,788	2,765	895
County	4,442	5,784	1,371
Essex	1,875	2,439	678
Hudson	1,100	1,781	352
Camden	700	733	100
Cumberland	285	252	54
Burlington	250	256	37
Atlantic	232	323	150
Proprietary (13)	463	425	762

Source: N. J. Dept. Institutions & Agencies

These facilities do not include the Arthur Brisbane Child Treatment Center, which until recently was associated with the State Hospital at Marlboro but is now located in Allaire, New Jersey. This unit serves as a center for the reception, examination, and treatment of emotionally disturbed children.

OVERCROWDING IN STATE MENTAL HOSPITALS

The normal capacities of the 3 state mental hospitals have been calculated on the basis of space standards promulgated by the American Psychiatric Association. With these capacities as a base the situation in regard to overcrowding appears on the following table:

Hospital	Normal capacity	Average census 1946	Number over capacity	Per cent overcrowded
Greystone Park	4237	5685	1448	34.2%
Marlboro	1788	2765	977	54.6
Trenton	2852	3099	247	8.7

Source: N. J. Dept. Institutions & Agencies

According to these standards the patient overload in the three hospitals is 2672. These standards are admittedly high; but by any lower acceptable standards the state hospitals are still overcrowded by at least 1800-2000.

MENTAL HOSPITAL PATIENTS BY COUNTIES

Five of the most populous counties in the state contributed 63.2 per cent of the 17,311 patients in state and county mental hospitals on June 30, 1946. These counties are Essex, Hudson, Passaic, Bergen, and Union.

COUNTY OF RESIDENCE OF PATIENTS IN
STATE AND COUNTY MENTAL HOSPITALS IN NEW JERSEY

MENTAL HOSPITAL PATIENTS AND THE GENERAL POPULATION IN NEW JERSEY 1930-1946

RATE PER 100,000 GENERAL POPULATION

Source : N.J. Dept. Institutions + Agencies

TREND IN MENTAL PATIENTS

In the sixteen-year span 1930-1946 the average patient population in state and county mental hospitals increased from 10,739 to 17,333, although it is to be noted that in the last five years there was a decided slowing-up both in the number of hospital admissions of mental patients and in the accumulation of patients in mental hospitals.

PATIENTS IN STATE AND COUNTY MENTAL HOSPITALS IN NEW JERSEY

1930 - 1946

Fiscal year	Patients in state and county mental hospitals		Rate per 100,000 general population	
	Average census	Number of first admissions	Average census	Number of first admissions
1930	10,739	2,722	265.7	67.4
1935	14,095	3,001	343.7	73.2
1940	16,420	3,271	394.7	78.6
1941	16,605	3,502	399.1	84.2
1942	16,917	3,608	406.6	86.7
1943	17,042	3,358	409.6	80.7
1944	16,987	3,344	408.3	80.4
1945	17,143	3,465	412.1	83.3
1946	17,333	3,674	416.6	88.3

Source: N. J. Dept. Institutions & Agencies

The following may be advanced as reasons for the growing number of mental hospital patients:

First, the transformation of mental institutions from custodial asylums into well-equipped hospitals with programs of treatment and rehabilitation. Many patients who formerly would have avoided mental hospital admission are now cognizant of the benefits of institutional care.

Second, earlier recognition of mental disorders, particularly among those with milder forms of mental disease, and utilization of mental hospitals for treatment purposes.

Third, the progressive "aging" of the state population has swelled the numbers of the older people among whom relatively more mental disease occurs. At the same time, homes for the aged and infirm are showing increased disinclination to accept persons with mental disorders.

THE AGED MENTALLY ILL

Mental illness among the aged constitutes a large and growing public health problem even if based only on mental hospital figures. Such figures admittedly are incomplete, since many aged persons who suffer from mental illnesses associated with old age, chiefly arteriosclerosis and the senile psychoses, are cared for in the community.

First admissions to mental hospitals in New Jersey and elsewhere show an increasing proportion of persons 65 years and older.

	1920	1940	1945
Total first admissions	1,743	3,271	3,465
Persons 65 years and over	230	824	1,102
Per cent of first admissions 65 years and over	13.2%	25.2%	31.8%

Source: N. J. Dept. Institutions & Agencies

The incidence of hospitalized mental illness among the aged is increasing at a more rapid rate than can be accounted for by the increase in the number of aged persons in the general population of the state. It is shown by the fact that in 1920, 172 individuals were admitted to mental hospitals per 100,000 of the population aged 65 and over, while in 1946 the corresponding rate was approximately 415 per 100,000 of the population aged 65 years and over.

MENTAL HYGIENE CLINICS

Mental hygiene clinics are designed to deal with the numerous mental and personal maladjustments. They serve both children and adults who are in need of guidance and help in remedying personality difficulties and emotional conflicts; children with reading disabilities, speech difficulties, behavior disorders, and school adjustment problems; adults with so-called "nervous difficulties" or apprehensive mental disorders; persons who are uncertain about educational or vocational abilities and training.

<i>Community Clinic</i>	
Psychiatric and psychological	20
Psychiatric or psychological	9

Source: N. J. Dept. Institutions & Agencies

State-operated clinics were conducted in some 31 different New Jersey communities in 1947 and nearly 900 clinic sessions were held. In 26 of these communities regular clinic schedules were maintained for combined psychological and psychiatric services. In communities where attendance warranted clinics were operated on a weekly schedule while in others bi-weekly or monthly schedules were adopted. In a number of towns where regular clinics could not meet the particular needs, special psychological and special psychiatric clinics were held. Many of these special clinics were held in schools or institutions.

Additional psychiatric clinic services were rendered by the Essex County Mental Hygiene Clinics, Essex County Juvenile Clinic, Child Guidance Department of the Newark Board of Education, etc.

During the last five years, New Jersey state mental hygiene clinics have cared for more than 3,000 different patients annually. In the course of each year these patients made an average of approximately 4,000 visits.

MENTAL HYGIENE PROGRAM

A comprehensive mental hygiene program would include:

1. Continuing our efforts to transform existing mental hospitals into modern treatment and curative institutions. This means the provision of adequate treatment facilities and a trained medical staff with consultants to carry on intensive treatment work, using the approved methods of treatment applicable to these patients.
2. Extending psychiatric social service or follow-up field work, so as to enable mental hospitals to parole early under proper conditions and safeguard a greater number of patients who can be satisfactorily adjusted in the community.
3. Extending the system of mental hygiene clinics based on the mental hospitals to serve the communities in the diagnosis of mental and nervous disorders, and to reach potential sufferers from nervous or mental disorders before the definite breakdown occurs.
4. Recognizing that part of a working plan for the guidance of school teachers, nurses, and medical officers in their work with children which will enable them to note evidences of nervous and mental instabilities on the basis of which they may direct suitable cases to the nearest psychiatric clinic where advice and preventive treatment may be secured.
5. Encouraging local communities to develop psychiatric departments for mental and nervous patients as part of the local general hospitals.* Such a psychiatric department connected with a general hospital would be valuable as a "first aid station". It is suitable for the nervous patient who feels the need of special care but is unwilling to go to a public hospital for mental disease.

* For details see The Care and Treatment of Nervous and Mental Patients in General Hospitals, By Emil Frankel and T. B. Kidner, Publication 18, N. J. Department of Institutions and Agencies.

RELATED MENTAL HYGIENE INSTITUTIONS

The Federal Hospital and Construction Act specifically excludes institutions for the mentally deficient and epileptics from participation in the Federal fund-matching program. It seems advisable, however, to make a brief reference in this source book to these related hospital facilities:

Institution	Resident population June 30, 1946	Total admissions during year
North Jersey Training School <i>Females aged 8-21 years - Trainable</i>	621	73
State Colony for Feeble-minded Males - New Lisbon <i>Males aged 8 years and over - High grade imbeciles and morons</i>	882	92
Vineland State School <i>Females aged 5 years and over - all levels</i>	1743	104
State Colony for Feeble-minded Males - Woodbine <i>Males aged 5 years and over - low grade</i>	766	65

VI. FACILITIES FOR CHRONICS AND CONVALESCENTS

FACILITIES AND SERVICES

Considering the two county hospitals for chronic diseases (*Camden and Hudson*) and including 19 public welfare houses, 6 charitable homes for chronics and convalescents, and the 80 relatively small proprietary nursing and convalescent homes, we have provisions for 5,545 chronic and convalescent patients.

NUMBER OF CHRONICALLY ILL

In the "chronic" disease group there are included generally those diseases or affections which persist for relatively prolonged periods of time, as contrasted with "acute" illnesses of short duration, or convalescence periods of only a few weeks.

Patients suffering from chronic diseases generally are unable to follow the customary daily routine of the average normal person and are in definite need of medical or nursing care of varying extent and over prolonged periods.

Definite figures on the prevalence of chronic diseases among the population of New Jersey are not available. We may resort to estimates based upon the authoritative calculations resulting from the house-to-house canvass made by the National Health Survey in 1935-1936. According to these findings the following New Jersey figures may be deduced:

CHRONICALLY ILL IN NEW JERSEY
Estimated by Counties

County	Number of persons with chronic disease or permanent impairment	Number of chronic invalids
All counties	736,350	47,425
Atlantic	21,960	1,414
Bergen	72,507	4,670
Burlington	17,171	1,106
Camden	45,264	2,915

TOTAL DEATHS BY AGE GROUPS IN NEW JERSEY 1900 and 1945

1900

1945

The estimated number of chronic disease cases and invalids in New Jersey among the more important chronic diseases are given below:

Disease	Estimated number of chronic disease cases in New Jersey	Estimated number of invalids in New Jersey
Rheumatism	226,050	4,870
Heart diseases	122,100	4,750
Arteriosclerosis and high blood pressure	122,100	2,010
Nephritis and other kidney diseases	51,150	1,020
Cancer and other tumors	30,690	920
Diseases of female organs	23,760	610
Diabetes mellitus	21,780	1,130

Source: N. J. Dept. Institutions & Agencies

THE AGING OF THE POPULATION

The problem of the chronically ill is becoming increasingly acute because, as the average expectancy of life increases, so does the proportion of persons of the ages in which we find the majority of the chronically ill.

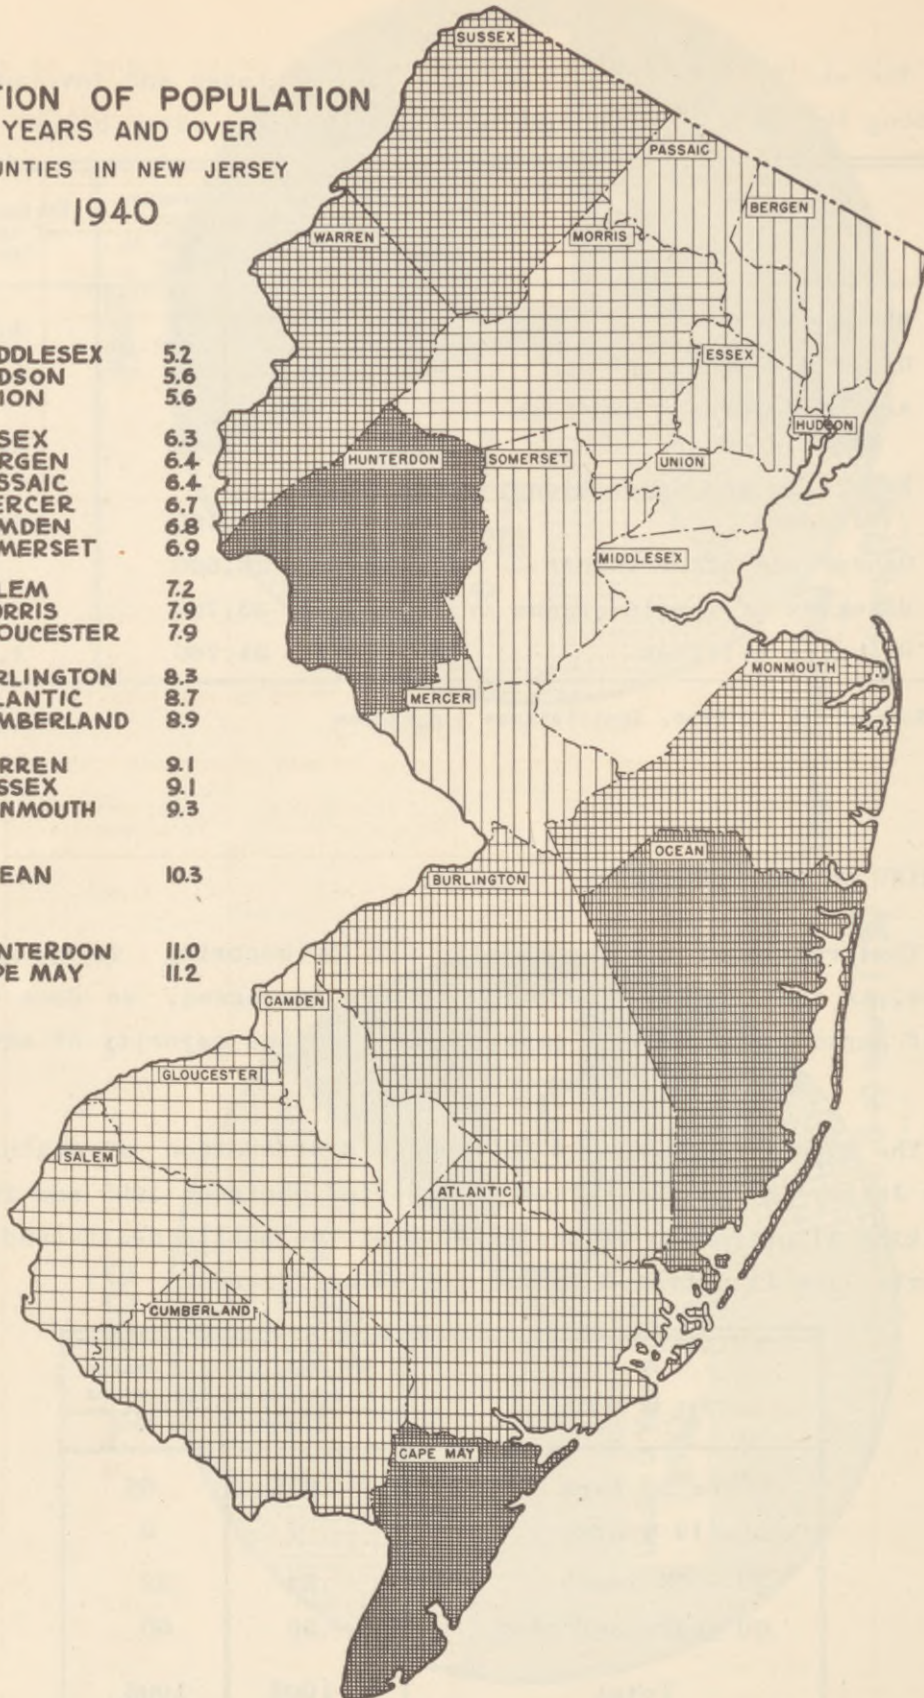

The significant changes in the age distribution of deaths occurring in New Jersey in the forty-five year period, between 1900 and 1945, giving a striking illustration of the effects of the public health and related movements, are illustrated in the following figures:

Age at death	Per cent of total deaths in specified age period	
	In 1900	In 1945
Under 5 years	33%	6%
5 - 19 years	7	2
20 - 59 years	34	32
60 years and over	26	60
Total	100%	100%

PROGRAM FOR THE LONG-TERM PATIENT

Any program for the long-term patient must embrace the following elements:

1. Recognition of the fact that there cannot be one level of medical care for acutely ill persons and another, inferior level of medical care for chronically ill persons. The quality of medical care must be essentially the same for both groups and it must be available irrespective of capacity to pay.
2. Recognition that a comprehensive program of medical, hospital, and nursing home care must be provided, utilizing both public and private resources.
3. A central information service in the community to promote public understanding of the needs of the chronically ill.
4. A medical program directed toward early detection and early treatment of illnesses -- which are likely to develop into chronic illnesses if left untreated.
5. Medical research directed toward preventing chronic illness.

VII. COMMUNICABLE DISEASE HOSPITALS

Special hospitals for contagious diseases are maintained at county expense in each of three counties in New Jersey - Bergen, Essex and Hudson. A special contagious disease hospital is also maintained at municipal expense in seven cities - Atlantic City, Camden, Elizabeth, Jersey City, Passaic, Paterson and Trenton. In Morris County a separate contagious disease pavilion as a county project is maintained in connection with a general hospital in Morristown.

Data about the location of special contagious disease hospitals, their normal capacity and the extent to which they were utilized in 1946 are shown below:

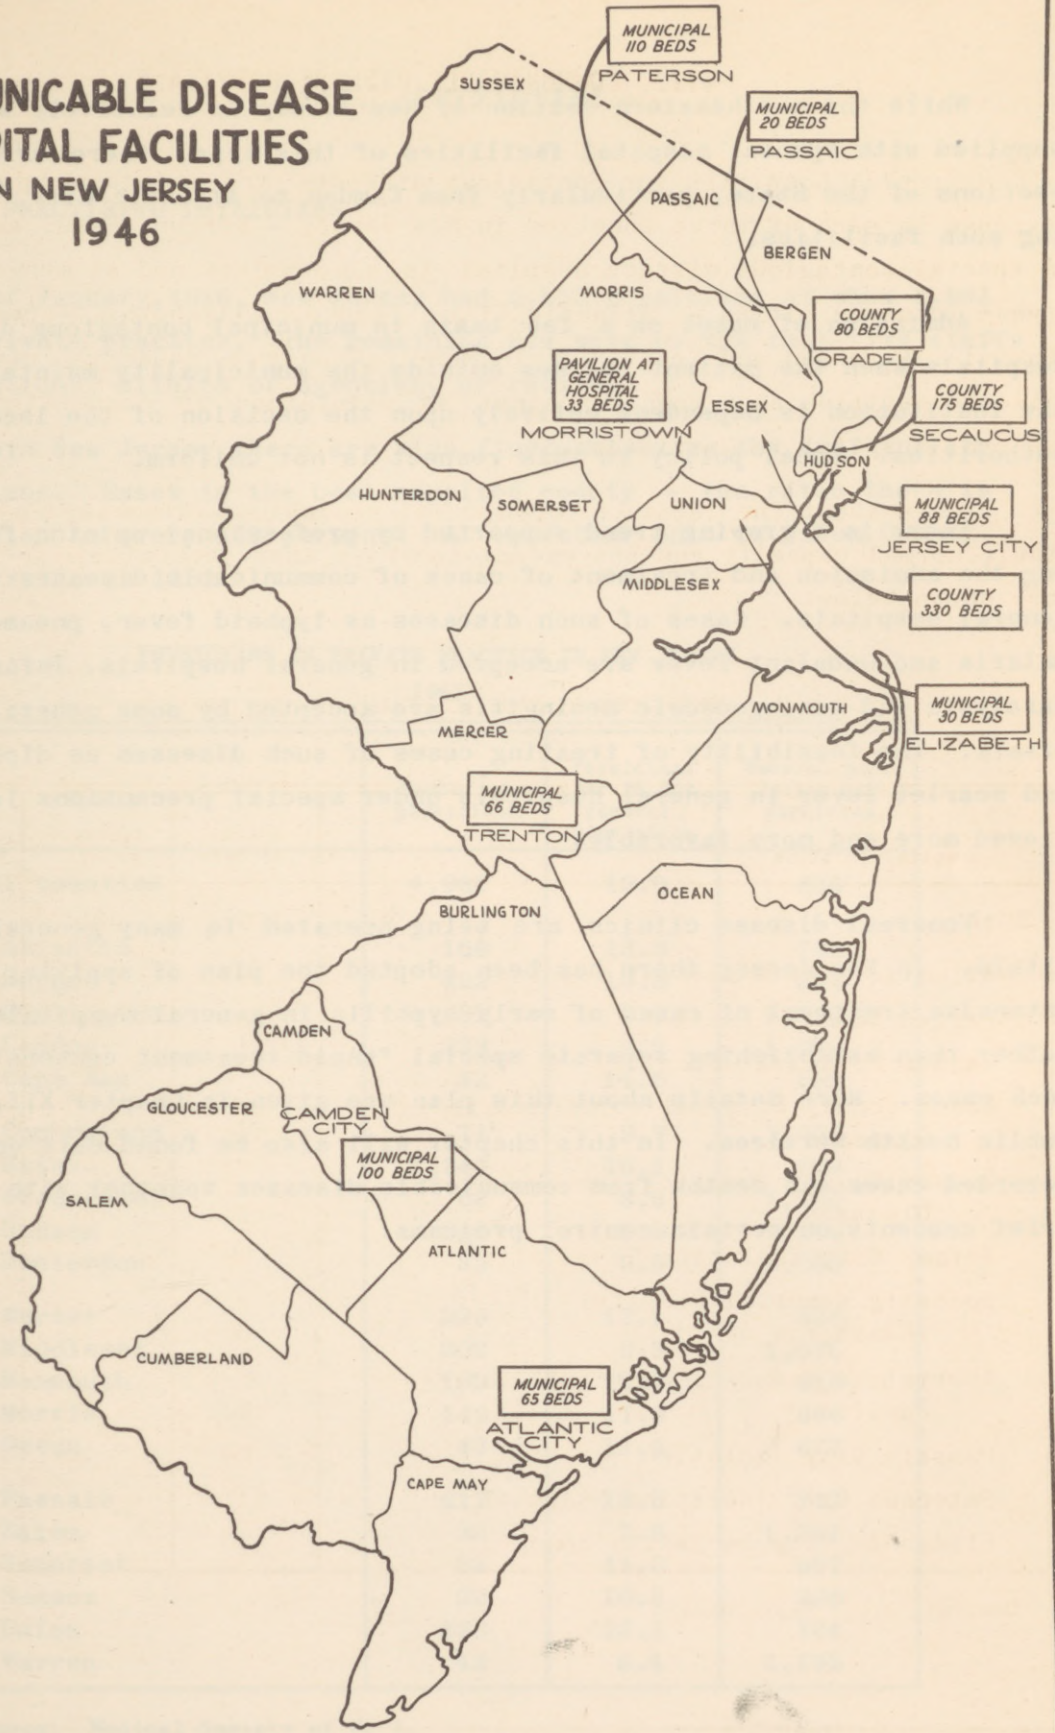

CONTAGIOUS DISEASE HOSPITALS IN NEW JERSEY

1946

Hospital location	Number of beds	Average census	Admissions
Total	1097	339	5480
Atlantic City Municipal Hospital	65	1	8

COMMUNICABLE DISEASE HOSPITAL FACILITIES IN NEW JERSEY 1946

Source : N. J. Dept. Institutions + Agencies

While the northeastern section of New Jersey is relatively well supplied with special hospital facilities of this type, there are sections of the State, particularly from Camden to Atlantic City, lacking such facilities.

Admission of cases on a fee basis to municipal contagious disease hospitals when the patient resides outside the municipality maintaining the institution is dependent entirely upon the decision of the local authorities. Local policy in this respect is not uniform.

There is a growing trend supported by professional opinion favoring the admission and treatment of cases of communicable diseases in general hospitals. Cases of such diseases as typhoid fever, pneumonia, malaria and undulant fever are accepted in general hospitals. Infantile paralysis and meningococcic meningitis are accepted by some general hospitals. The feasibility of treating cases of such diseases as diphtheria and scarlet fever in general hospitals under special precautions is being viewed more and more favorably.

Venereal disease clinics are being operated in many general hospitals. In New Jersey there has been adopted the plan of applying the intensive treatment of cases of early syphilis in general hospitals rather than establishing separate special "rapid treatment centers" for such cases. More details about this plan are given in Chapter XII, Public Health Services. In this chapter will also be found data on recorded cases and deaths from communicable diseases together with brief comments on certain control programs.

VIII. PHYSICIANS

NUMBER OF PRACTISING PHYSICIANS

As of January, 1946, New Jersey had 5,655 physicians of whom 4,981 were in private practice. The remaining 674 were on the full-time staffs of institutions, clinics or agencies, or retired.

Within New Jersey there are wide fluctuations in the availability of physicians. Essex is the best supplied county - the ratio there is one physician to every 622 persons. At the other pole is Salem County where the ratio is 1281.

PHYSICIANS IN PRIVATE PRACTICE IN NEW JERSEY
1947

County	Number of physicians	Physicians per 10,000 general population	General population per physician
All counties	4,981	12.0	835
Atlantic	168	13.5	738
Bergen	422	10.3	971

PHYSICIANS IN PRIVATE PRACTICE IN NEW JERSEY 1947

BY COUNTIES

Physicians Per 10,000 General Population

Under 9.0	SALEM	7.8
	BURLINGTON	8.3
	WARREN	8.4
	GLOUCESTER	8.6
9.0-10.9	CAMDEN	9.3
	MIDDLESEX	9.3
	HUNTERDON	9.5
	CUMBERLAND	9.7
	HUDSON	9.9
	BERGEN	10.3
	SUSSEX	10.8
11.0-12.9	SOMERSET	11.0
	OCEAN	11.4
	MORRIS	11.9
	MERCER	12.1
	MONMOUTH	12.3
13-14.9	UNION	13.1
	PASSAIC	13.5
	ATLANTIC	13.5
	CAPE MAY	14.5
15 and over	ESSEX	16.1

The added comment might be made that there is a ratio of one private practitioner for every 835 persons in New Jersey; or one doctor of medicine to every 736 persons if all physicians are counted. This compares favorably with the national average of one medical practitioner to every 752 persons. Considering that New Jersey has no medical school (*it is, indeed, the most populous state in the union without one*) and that the huge medical centers at New York and Philadelphia are readily available from every part of the state, this is an index of an adequate supply of medical personnel.

The long-term trend in the total number of physicians residing in New Jersey may be gleaned from figures compiled by the American Medical Association:

NUMBER OF PHYSICIANS RESIDING IN NEW JERSEY

Year	Number of physicians
1906	2,332
1909	2,455
1912	2,884
1914	3,012
1916	3,239
1918	3,153
1921	3,260
1923	3,362
1925	3,567
1927	3,755
1929	4,045
1931	4,357

RESIDENCIES TRAINING IN HOSPITALS

Residency training in hospitals is under the constant scrutiny of three national medical bodies - the American Medical Association, the American College of Surgeons and the various specialty examining boards. Most favorable status for development of a residency is affiliation with a medical school, graduate or undergraduate. Since New Jersey has no medical school in either category, one would expect that the number of residencies in this state would be small. However, the state has 146 approved residencies - as many as Maryland, Michigan or Massachusetts, all states of comparable population, but each having two or more medical schools.

APPROVED RESIDENCIES IN NEW JERSEY
1947

INTERNSHIPS IN HOSPITALS

New Jersey hospitals offer 464 internships of which 400 are approved by the American Medical Association. Most of the others are approved by the State Board of Medical Examiners, which requires only a minimum of 75 beds in a hospital compared to the 100 bed minimum required by the American Medical Association. A listing of all internships by counties follows:

INTERNSHIPS IN NEW JERSEY

IX. DENTISTS

NUMBER OF PRACTISING DENTISTS

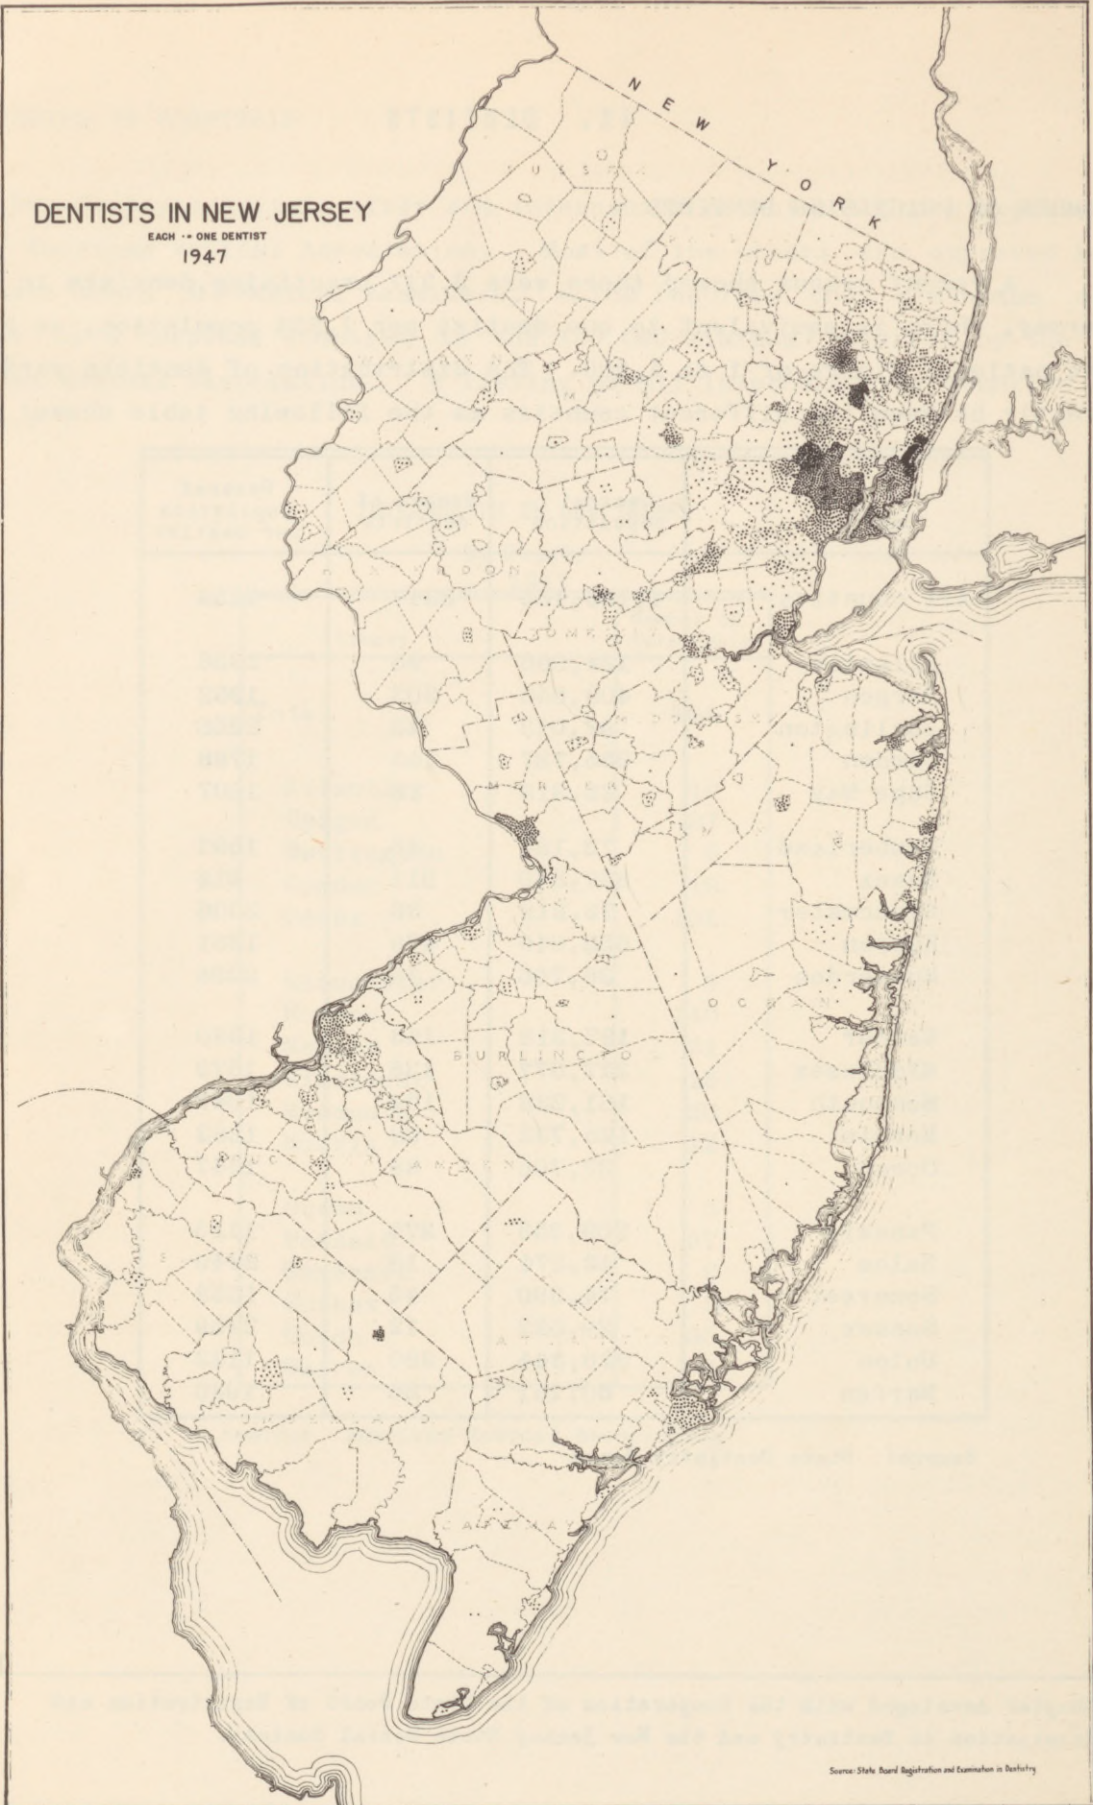

A recent census showed there were 3,317 practising dentists in New Jersey, which is equivalent to one dentist per 1,254 population, as against the national figure of 1 to 1,800. The distribution of dentists varies greatly between the different counties as the following table shows:

County	General population	Number of dentists	General population per dentist
All counties	4,160,165	3317	1254
Atlantic	124,066	95	1306
Bergen	409,646	303	1352
Burlington	97,013	43	2256
Camden	255,727	143	1788

DENTAL SERVICES IN HOSPITALS

The following gives the available data on dental services in hospitals:

- 33 hospitals have dental clinics
- 39 hospitals have no dental clinics
- 25 hospitals have a dentist on call
- 10 hospitals employ dentists, paying them for time given institution
- 9 hospitals have dental internes.

In addition to the above, the Department of Institutions and Agencies provides dental services for all persons in its hospitals and institutions.

DENTAL FACILITIES IN ROUNDED PROGRAM

The rounded New Jersey dental program provides dental health services which include:

School Dental Programs. Sixty per cent of school districts have some dental care programs which constitute the most important phase of the dental health program in the state. These programs have been developed by local boards of education and departments of health cooperating with the local and State dental societies. In some areas the State Department of Health subsidizes dental care programs for children.

State and Local Health and Welfare Agencies. The State Department of Health through its dental division provides dental service programs in parochial schools, and trailer clinics in rural areas. Other local health and welfare agencies conduct dental programs in cooperation with the State and local dental societies. The State Board of Child Welfare provides dental services for its wards.

State Institutions. Dental services are provided for all the persons under their care.

Federal Government Programs. Some Federal Government programs have provided dental care from time to time, at present the one most active is the Veterans' Administration program of service-connected dental disability. This is being carried on mainly in private offices under an agreement between the Veterans' Administration and the State Dental Society. Some service is rendered in Veterans' Administration dental clinics.

Educational Programs. By no means the least important dental health service in New Jersey is the coordinated dental health education program carried on by the State Dental Society through its Council on Dental Health, the State Department of Health, the State Department of Education and the lay dental health committee.

XI. PHARMACISTS

On May 31, 1945, there were 4,154 registered pharmacists in good standing in New Jersey. On this same date there were 1,717 pharmacies registered with the Board of Pharmacy, of which 42 were hospital pharmacies. These were staffed by an average of 1.6 registered pharmacists per pharmacy.

There is a fair distribution of pharmacies throughout New Jersey with an average of one pharmacy per 2,546 population. This compares favorably with the national average. The following table shows the distribution of pharmacies by counties:

NUMBER OF PHARMACIES BY COUNTIES

County	Number of permits in force	Hospital pharmacies and dispensaries	General population per year-round Rx pharmacy
All counties	1717	42	2546

XII. PUBLIC HEALTH SERVICES

MUNICIPAL HEALTH DEPARTMENT FACILITIES

The official Public Health Services in New Jersey are established according to the law on local and state levels. Each of the 566 municipalities has a Board of Health or corresponding body which, theoretically at least, handles its specific local responsibilities. In nine municipalities the local Health Department is housed in a building for its exclusive use. In practically all other municipalities, having a population of 15,000 or more, office facilities are provided in buildings used also by other branches of the municipal government. Many auxiliary facilities are in service by local Health Departments for such things as infant and maternal health, tuberculosis control, venereal disease clinics, and dental and mental hygiene. Some of these are in hospital out-patient departments; many are in schools and other public buildings; a few are in quarters rented or donated for special purposes.

Grouping of Boards of Health of the smaller communities into larger population units for greater administrative efficiency has been attempted but, in the main, has not met with much permanent success. Establishment of County Health Departments in the smaller counties has been recommended, but has not yet been authorized by law.

The State Health Department has many functions, state-wide and local. One of these services consists of eight District Health Offices whose personnel act in an advisory capacity to the local health officials in the areas they cover. These areas together include about 56% of the whole population. The Bureau of Maternal and Child Health has been instrumental for many years in stimulating local interest and participation in public health nursing, with special emphasis on mothers and babies. The state laboratory provides free examination of specimens for evidence of many communicable diseases, as well as for the examination of water, milk, and some foods. Other activities of the State Health Department, which reach down more or less to the local level, are those concerned with Dental Hygiene, Venereal Diseases, Tuberculosis, Cancer, Industrial Hygiene, Negro Health, Sanitary Engineering, and Food and Drugs. The Bureau of Vital Statistics collects, tabulates, reports on, and keeps extensive records of births, marriages, and deaths, many references to which have been used in this book.

Several other divisions of the State Government also have a part in the health program. Chief among these are the Departments of Education, Agriculture, Labor, and Institutions and Agencies. More or less directly associated with these, and with very definite health angles to their responsibilities, are the Migratory Labor Board, the Agricultural Experiment Station, the State Board of Child Welfare, the Commissions for the Blind, Crippled Children, and Rehabilitation.

Numerous state-wide, unofficial organizations also render a vast amount of local public health services, such as the Tuberculosis League, the State Cancer Society, Red Cross, and the National Foundation for Infantile Paralysis. Many county, regional, and municipal organizations, official and voluntary, also have a part in this program. Some brief references are made to these activities in the pages which follow, especially in the sub-sections on Public Health Nursing, Visiting Nurse Associations, Tuberculosis, Cancer, Malaria, and Infantile Paralysis.

The following table by no means indicates adequately the extent of local health services in the state, but it is an indication of how the matter stands. The shortage of trained personnel in local Health Departments, especially in the rural areas, is evident. No *full-time*, licensed health officer or sanitary or food inspector is employed in any municipality in 6 counties. Somewhat over half (61%) of the population of the state is supplied with one or more licensed, *full-time* health officials employed by the municipal Health Departments. A more complete idea of the persons actually in the field can be secured by considering all the public health nurses, working for and paid by various organizations, including local Health Departments, listed by counties in this report on Page 80.

At least \$1.00 per capita per year is generally agreed to be minimum for good, local, health work and it will be seen from this table that only in one county (Essex) does the total of municipal appropriations come up to this minimum standard.

PUBLIC HEALTH NURSING

In New Jersey the public health nurse plays an important role in the prevention of disease, in the control of epidemics, in the early detection of remedial infections, in teaching sound health practices and, frequently, in the care of illness in the home.

Certain basic services are essential in any well-planned program of public health nursing. These include assistance to the health officials in the prevention and control of communicable diseases, including tuberculosis and venereal diseases; maternal and child health services; school health programs. Many communities also find that there is a need for assistance with industrial health work, crippled childrens' services, and bedside help to the chronically ill. The care of the chronic disease patient in the home has steadily increased as a community problem in direct proportion to our changes in family living and to the lengthening of the average life span.

Public health nursing services are now generally financed and administered in the following ways:

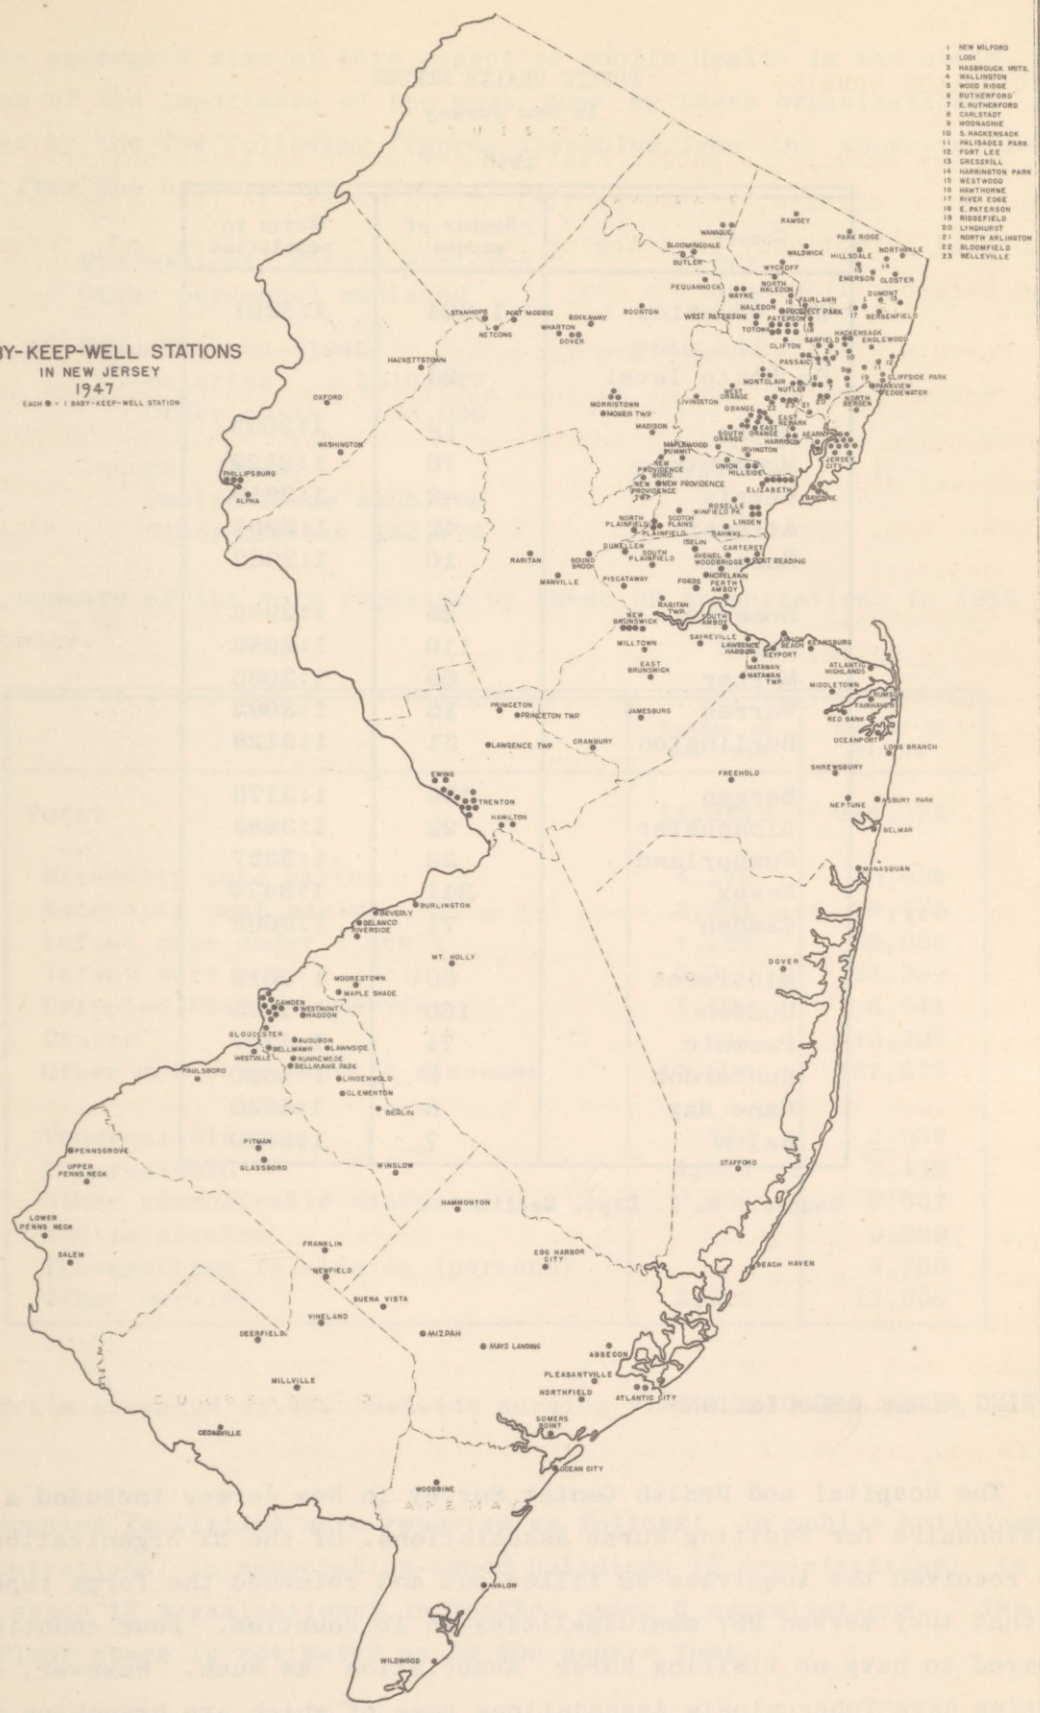

By local Health Departments and other official organizations through appropriation of public money; by community agencies on a privately financed or individual payment basis; through the medium of insurance companies and industrial concerns.

A census of nurses employed by public agencies in New Jersey has recently been completed by the State Department of Health. The result of this survey shows that 1264 such nurses were then engaged in this field as shown in the accompanying table. This number is impressive, but the figures do not always indicate a high degree of efficiency. A critical analysis of this census reveals nurses giving full time to some aspects of health work in areas where little attempt is made to cover the other aspects. Inadequate planning or lack of periodic surveys sometimes result in duplication of efforts by more than one agency.

VISITING NURSE ASSOCIATIONS

The Hospital and Health Center Survey in New Jersey included a questionnaire for Visiting Nurse Associations. Of the 51 organizations that received the inquiries 39 filled out and returned the forms reporting that they served 287 municipalities in 16 counties. Four counties appeared to have no Visiting Nurse Association as such. However, all counties have Tuberculosis Associations some of which are branching out into more or less generalized nursing activities.

The aggregate size of this aspect of public health in the state, and something of the importance of the work done by these organizations, are indicated by the few following figures assembled from the above-mentioned reports from the 39 nursing organizations.

Professional nurses employed	264
Other personnel employed	112
Expenditures (1945)	\$646,223
Salaries	\$510,127
Other costs	136,096
Income (1945)	\$608,272
Public funds	\$155,498
Other sources	452,774

A summary of the work reported by these 39 organizations in 1945 is listed below.

	Number of patients	Number of visits
Total	41,215	314,274
Maternity ante partum	4,178	10,085
Maternity post partum	3,931	24,475
Infant care under 1 month	4,286	22,053
Infant care over 1 month	3,320	24,359
Crippled Children service	1,496	6,644
Cancer	843	10,799
Other non-communicable diseases	14,809	167,375
Venereal disease	749	3,532
Tuberculosis	1,221	8,418
Other communicable diseases	2,456	8,637
Aid in clinics		9,289
Transporting to clinics (persons)		4,750
Other service	3,926	13,858

Free visits averaged 41.4%. Bedside nursing visits averaged 46.2%

Housing facilities were reported as follows: In public buildings 12 organizations; in association-owned buildings 12 organizations; in rented space 12 organizations; in donated space 3 organizations. The total floor space is estimated as 28,800 square feet.

DENTAL SERVICES

The Dental Program of the New Jersey State Department of Health helps to provide dental treatment to children of low income families in rural and suburban areas. With the aid of state, county, and local dental health committees, representing health, welfare, and educational agencies, all programs are administered by local authorities with the financial and supervisory help of the Division of Dental Health. Local and county agencies contribute funds for the programs. As of January 1, 1947, the State Department of Health has sponsored dental treatment programs for children in 172 communities.

An attempt is made to give to each child admitted to the program all necessary extractions and fillings. During the fiscal year of 1946-1947, 5,732 children were treated. Of these, 3,934 or 69%, were given all necessary extractions and fillings.

The State Department of Health employs part-time dentists who operate in private offices, clinics, dental trailers, and dental mobile clinics (*built on truck chassis*). In two counties station wagons are used to transport children to dental centers. Three new mobile clinics will be established in Atlantic, Cape May, Gloucester, and Warren Counties during 1947. With these units in use, low income children from more than 200 communities will be provided dental treatment by the State Department of Health.

In 68 communities dental care programs for children are sponsored by Boards of Education; in 12 communities by local Boards of Health. In 6 communities programs are sponsored by Boards of Education jointly with Boards of Health. It may be estimated that approximately 60,000 children are treated in public dental care programs by such local agencies. All of the local programs provide extractions of unsavable teeth. Most of the programs provide silver amalgam, cement, and silicate fillings.

The State Department of Institutions and Agencies provides dental treatment for its wards, both dependent children and home-life children, by sending them to private offices where dental services are rendered on a fee basis.

Something of the extent of these public dental services is indicated by the map on the following page.

PUBLIC DENTAL SERVICE FACILITIES AND PROGRAMS IN NEW JERSEY 1947

- + Hospital with Dental Services.
- Local Program for Children, low income families.
- State Program for Children, low income families.
- ◻ Combined Local and State Programs for Children, low income families.

LABORATORIES

The State Health Department has recently issued a revised list of 106 laboratories authorized to make tests of various kinds. In addition they have prepared a statement of references to existing laws and Sanitary Code regulations relative to laboratory services in New Jersey. The three general types of work authorized are:

Examination for certain communicable diseases	89 laboratories
Pneumonia typing (Very little call for this now)	55 laboratories
Blood testing for evidence of syphilis	91 laboratories

As of January 1, 1947 the approved laboratories were classified and grouped as indicated below:

INDUSTRIAL HYGIENE

The primary functions of the Division of Adult and Industrial Health of the State Department of Health are to promote and develop in industry in-plant medical facilities, personnel adequate for the care of injuries, and the development of good industrial public health practices. This would include pre-placement and periodic examinations of all employees and special examinations of those exposed to potentially toxic materials. It would also include the development of the Medical Department as the center of other public health measures in industry such as venereal disease control, tuberculosis control, and the like.

The Division also carries on extensive evaluation, through medical, nursing, and engineering personnel, of suspected toxic industrial exposures wherein the health of the individuals exposed might be permanently affected.

The Division also acts as a clearing house of all public health programs which can be applied industrially, such as the tuberculosis control, venereal disease control, dental health, and the like.

The Division of Adult Industrial Health, in cooperation with local health offices, has completed seven industrial health surveys in various New Jersey communities. These surveys evaluate the environmental conditions and the medical services and facilities in industries. Along with this, studies of community welfare facilities are made. All this is followed by an attempt to coordinate the community facilities and industrial needs so that better health programs are made available to the industrial population.

VENEREAL DISEASES

How much venereal disease exists in New Jersey and how many new cases occur each year are not known with any great degree of accuracy. Inquiries have been made about syphilis in various ways, such as by studying the records of hospitals where blood tests are routine, by following carefully the evidence furnished by the prenatal and premarital laws, and by examining the military records of draftees. It appears from these sources that about 1% of young white adults have syphilis at any given time, with a higher percentage among Negroes. There is a definite downward trend in congenital syphilis and in deaths at all ages.

Gonorrhea is supposed to be several times as prevalent as syphilis, but neglect and self-treatment, together with incomplete reporting of cases by physicians, makes statistical knowledge about the subject very uncertain indeed.

The new drugs, especially penicillin, have very radically changed the problem of venereal disease. Whereas syphilis and gonorrhea used to be chronic, lasting for years even with good treatment, now most cases can be quickly cured, the former (early syphilis) in a few days and the latter in a matter of hours. The rapid treatment of syphilis has a definite connection with the subject of hospitals. Instead of having one or more places where this treatment was the sole business, as in most other states, a plan was put into effect in New Jersey during the war whereby 47 general hospitals agreed to treat early cases of syphilis at the authorization and expense of the State Department of Health. The hospitals keep the patients five or six days during which 2,400,000 units of penicillin are given as standard treatment. During 1945 there were 832 persons so treated and, in 1946, the number was 2249.

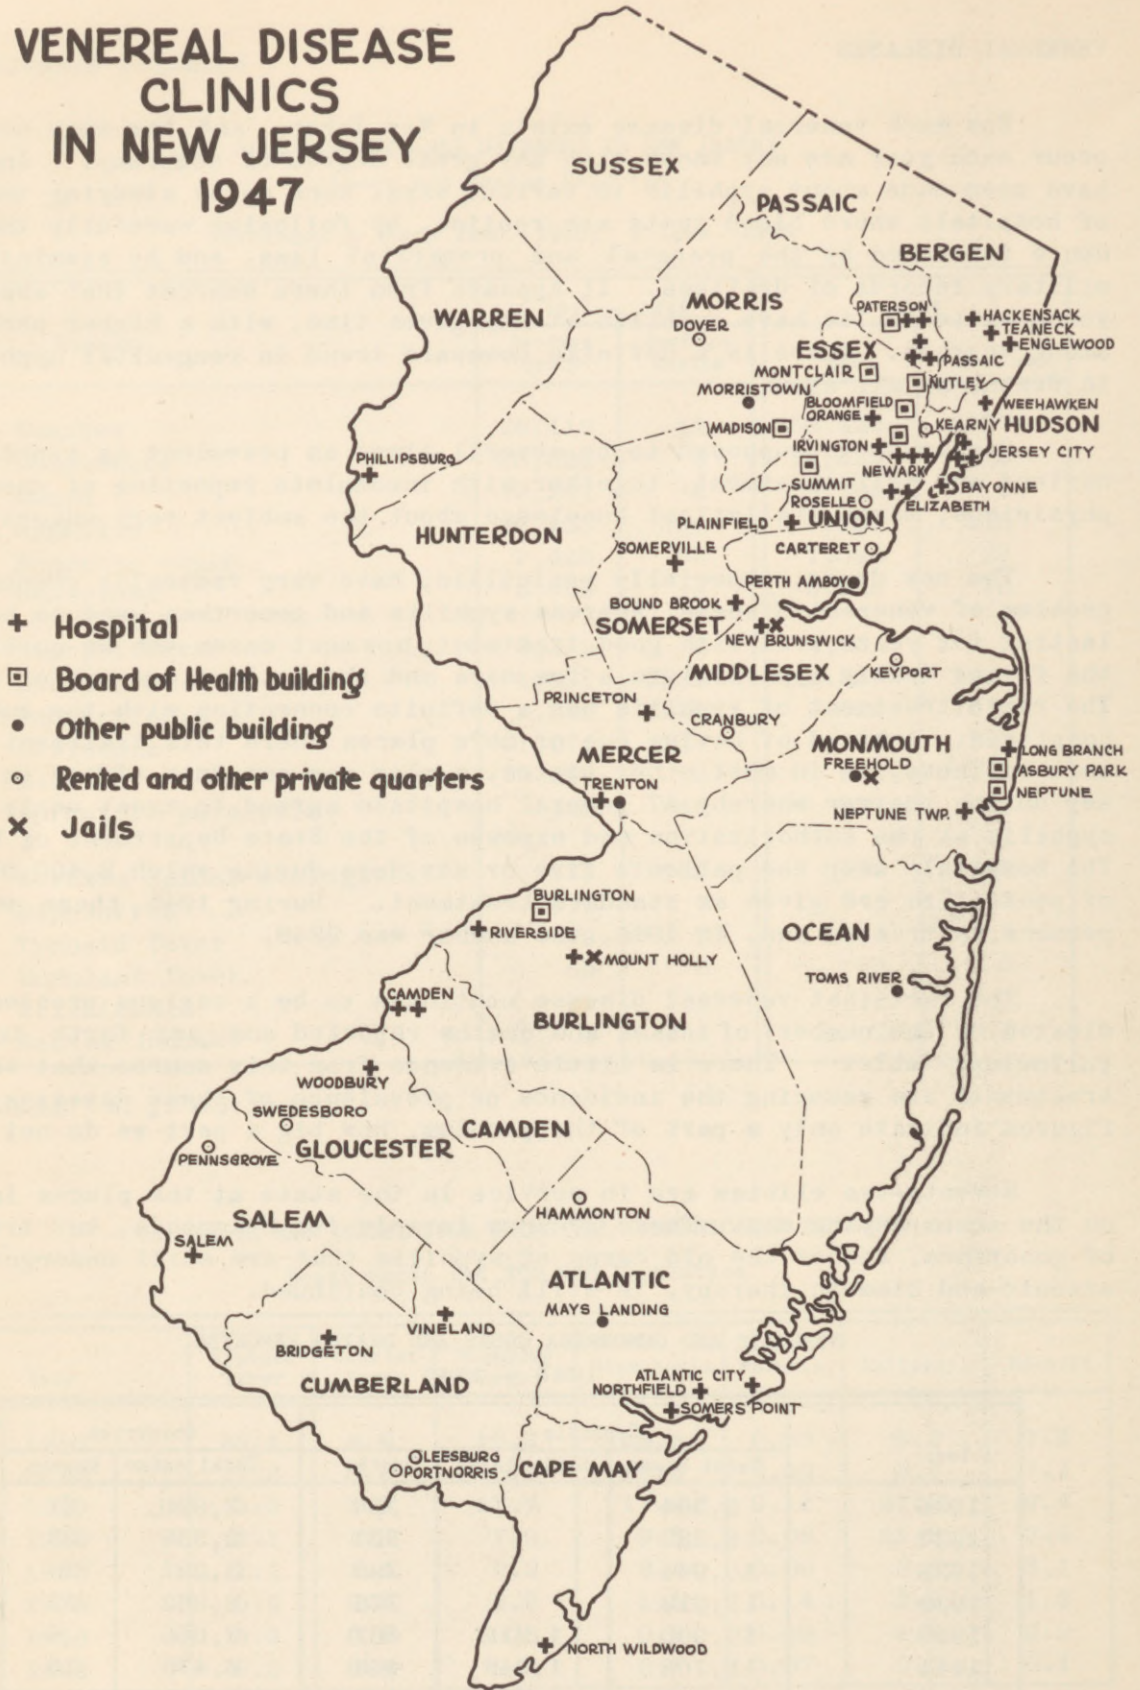

The fact that venereal disease continues to be a serious problem is indicated by the number of cases and deaths reported and set forth in the following table. There is little evidence from this source that the new treatments are reducing the incidence or prevalence of these diseases. These figures indicate only a part of the problem, how big a part we do not know.

Seventy-two clinics are in service in the state at the places indicated on the accompanying map. These are now largely for diagnosis, but treatment of gonorrhea, and of the old cases of syphilis that are still undergoing the arsenic and bismuth therapy, is still being continued.

SYPHILIS AND GONORRHEA CASES AND DEATHS REPORTED
1936 - 1946

Year	Syphilis			Gonorrhea	
	Total cases	Early cases	Deaths	Total cases	Deaths
1936	6,504		350	2,996	21
1937	8,282		351	3,333	23

- Rented and other private quarters
- x Jails

TUBERCULOSIS

Tuberculosis, as one of the major communicable diseases, is attacked by the entire Health Department and particularly through its Division of Tuberculosis Control. Morbidity and mortality data are assembled and implemented for use at the State Office.

The Division of Tuberculosis Control has a very active case-finding program. The photofluorograph has provided a powerful weapon when applied by mass techniques. This mass X-ray program is carried on among individual groups, both large and small, institutional groups, and community groups with particular emphasis on segments of society that are known to have more than their proportionate share of tuberculosis. The Division of Tuberculosis Control does all the surveying but many other divisions of the State Department of Health, and many other agencies and persons, participate not only in the organizational work but in the follow-up.

To carry out the case-finding effort which, to date, has serviced approximately 225,000 persons, the Division of Tuberculosis Control makes use of one mobile x-ray laboratory and three transportable photofluorographic units. The former is a sixty foot tractor trailer unit equipped with a 70 mm. photofluorograph, a complete dark room, six dressing booths and its own generator, light, and running water. The transportable units are moved from location to location about the State in three one and one-half ton trucks. Negative findings are reported, in most instances, directly to the individual. Positive findings are reported to the private physician named by the individual. All records are confidential.

The Division is also cooperating with local groups in the establishment of better diagnostic facilities throughout the State. The funds for equipment are supplied by the Division of Tuberculosis Control, whereas the organization of the clinic and its administration is left in the hands of health workers in the local community. Thus far five such clinics are already in operation and plans have been made for the establishment of at least six more. As the case-finding program increases, it becomes apparent that the establishment of these clinics is most essential. If we are to find many new and unchecked cases of the disease, adequate and sufficient clinical facilities must be available to local physicians.

There is also a consultant in tuberculosis public health nursing and her assistants in the Division. These persons, it is expected, will develop, promote and, in part, supervise the essential public health nursing services on tuberculosis throughout the State. Many of these services are provided through the Tuberculosis Leagues. The nurse-consultants coordinate these services with the total program.

RABIES

The fact that rabies is a potentially serious matter is indicated by the number of cases in animals (mostly dogs) reported each year, shown in the accompanying table. Dog bites run into sizeable numbers also, 14,167 being reported to the State Health Department, by local Boards of Health, in 1946.

Relatively few persons get rabies, for which there is as yet no cure. This is probably due to a realization on the part of the public of the importance of immediate treatment by a physician of all bites and of the value of the anti-rabic inoculations in cases where there is any suspicion that the animal might be mad. Local Boards of Health are required by law to give this treatment free to persons unable to pay. The State Health Department supplies most of the serum and, during 1946, withdrawal reports from local stations indicated that 370 persons were treated with material costing \$2,456.80.

RABIES IN NEW JERSEY

MALARIA AND MOSQUITO CONTROL

Malaria used to be one of the most serious public health problems in New Jersey. In 1881 there were 431 deaths reported. Since then the decline has been continuous until, as shown on the table on page 86, there have been only an average of 2 deaths per year since 1941.

A rapid increase in cases reported has occurred in the last few years, due almost entirely to men returning from the war. It was at first feared that these persons might be the source of more locally acquired cases, but such has not been the case. In 1946 only 6 cases, apparently infected in New Jersey, were reported out of a total of 931.

An aggressive mosquito control program for many years has probably been the main reason for the decline of malaria, as well as for the elimination in many areas of what had formerly been an almost state-wide pest. The County Mosquito Control Commissions have done a great deal of work and the money made available to them from public sources runs into sizeable figures, as shown by the appropriations in 1946, listed in this table.

APPROPRIATIONS FOR COUNTY MOSQUITO CONTROL
1946

County	Appropriation
All counties	\$515,071
Atlantic	28,965
Bergen	50,000
Burlington	9,600

INFANTILE PARALYSIS

The 21 county chapters of the National Foundation for Infantile Paralysis in New Jersey annually join the nation in its "March of Dimes" Campaign, proceeds of which are used to provide medical care to the victims of Infantile Paralysis regardless of age, race, creed, or color.

In addition to their fundamental work, mentioned above, the New Jersey Chapters have contributed \$2500 toward the cost of the state-wide study of child health services now being conducted by the American Academy of Pediatrics. The state study is a part of a nation-wide two-year survey to determine and evaluate the extent of existing child health services. The results of this survey will be of value to the National Foundation for Infantile Paralysis and its chapters in their effort to improve local facilities for the medical care of infantile paralysis patients, most of whom are children.

As part of the epidemic preparedness program, distribution of 618,000 leaflets listing precautions against polio has been made in schools throughout New Jersey in cooperation with state and local education authorities. Distribution of the leaflet, "A Message to Parents About Infantile Paralysis", is part of a nation-wide plan to present facts about the disease to allay fears and furnish reassurance to parents in the event of infantile paralysis outbreaks.

Also, as part of the epidemic preparedness program, a state-wide survey of equipment (*respirators, hot-pack machines, etc.*) was taken in an attempt to ascertain the location, condition, and quantity of equipment in New Jersey.

HEART DISEASE

There is some talk of a state organization which will devote its efforts to the heart disease field, possibly being affiliated with the American Heart Association. Something is being done locally by the Passaic County Tuberculosis and Health Association, and also by several interested organizations in Bergen and Essex Counties. Estimates by the State Department of Education of 11,500 heart cases in the public schools (*8600 rheumatic and 2900 congenital*) indicate the need for such a program among children. The Crippled Children's Commission, with its voluntary auxiliaries, is largely concerned with the end products of early rheumatic heart disease.

CANCER - AMERICAN CANCER SOCIETY, NEW JERSEY DIVISION, INC.

Providing funds for improvement of services in cancer clinics of 34 general hospitals in 16 counties of New Jersey, for permanent equipment, the establishment of county-wide gold radon seed pools for treatment of indigent patients in several counties, and for subsidization of visiting nurse fees for bedside nursing care of cancer patients, the *New Jersey Division, American Cancer Society*, has allocated \$304,986.46 since September 1, 1946, from funds contributed in 1946.

Other clinic projects are now being considered.

In addition to clinic projects, the Division's medical program has been directed toward early diagnosis. Publicity continually urged the people to receive periodic, complete physical examinations from their family physician. To cooperate with the physician, the biopsy program has been devised under joint sponsorship of the Medical Society of New Jersey, the Society of Clinical Pathologists, and the American Cancer Society. Thirteen hundred physicians have requested and received 6,000 biopsy containers prepared for use.

As the result of a survey 2,000 New Jersey physicians have signified their willingness to conduct complete physical examinations thus making this important cancer control measure available to New Jersey citizens through their family doctors. A complete list of physicians, who have signified their willingness to conduct health maintenance examinations, is being prepared for publication. This list will be especially helpful to persons who have no regular family physician in attendance.

CANCER - STATE HEALTH DEPARTMENT

The recently organized *Division of Cancer Control* in the *State Health Department* has plans for a Tumor Registry under joint auspices with the New Jersey Society of Clinical Pathologists. The Division is also collecting and filing cancer case histories, tissue slides, gross pathological specimens, photographs of pathological material, outlines of treatment, a system of follow-up, library facilities, and other data relative to tumors. Emphasis is being put on the various aspects of statistical research and professional education.

HEALTH SERVICES IN PUBLIC SCHOOLS

A part of the Hospital and Health Center Survey (1945) consisted of a questionnaire sent by the State Department of Education to the 1800 public schools in the State in which there are approximately 650,000 pupils. Some or all of the information requested was returned from 1206 schools and gives a good cross-section of their health activities. A summary of the answers is given here, which covers the following:

296,074 pupils in 994 elementary schools
 172,443 pupils in 212 high schools
 468,517 pupils in 1206 schools

The law requires all schools to have physicians. Of the 1206 schools reporting, 1145 employed 591 physicians, most of whom are on part time.

The law does not require employment of nurses but, of the 1206 schools reporting, 1149 had service from 664 individual nurses.

Nurses employed by local Boards of Education. 430
 Nurses employed by local Boards of Health.... 167
 Nurses employed by other agencies..... 67

Dentist employed at..... 275 schools (23%)
 Adequate dental service available at.. 574 schools (48%)
 Special room for health services at... 893 schools (74%)
 Hand washing facilities in health room. 665 schools (55%)
 Sterilizer for emergencies and
 immunizations at 484 schools (40%)
 Scales to weigh pupils at 864 schools (72%)
 All pupils physically examined
 annually at 1015 schools (84%)
 10 minutes or more for each
 physical examination at..... 438 schools (36%)

The law allows local Board of Education to require vaccination against smallpox and immunization against diphtheria.

100% of pupils reported vaccinated at 759 schools (63%)
 100% of pupils reported immunized at 410 schools (34%)

Eye tests given at 613 schools (51%)
 Hearing tests at 378 schools (31%)
 Mental hygiene consulting service at.. 474 schools (39%)
 X-ray consulting service at 505 schools (42%)
 Heart consulting service at 419 schools (35%)

It is estimated that there are 11,500 heart cases in the schools (1.75%). Of these 8600 are rheumatic (1.32%), and 2900 are congenital (0.43%).

Physical Education -

Ten questions dealt with athletics, gymnasiums, swimming pools, showers, time devoted to the programs, and so forth.

Health Instruction -

More than 30 minutes weekly devoted to Health Education at 537 schools (45%)
 Less than 30 minutes weekly devoted to Health Education at 263 schools (22%)
 No report at 406 schools (33%)

PUBLIC SCHOOL HEALTH EXPENDITURES

(1944 - 1945)

MEDICAL INSPECTION		NURSE SERVICE	
Salaries	\$452,363	Salaries	\$901,888
Expenses	42,083	Expenses	33,112
DENTAL INSPECTION		OTHER SERVICES	
Salaries	\$155,136	Salaries	\$121,297
Expenses	20,445	Expenses	63,244

Total \$1,789,568

XIII. POPULATION STATISTICS

TREND IN GENERAL STATE POPULATION

In the last two United States census decades - 1930 and 1940 - New Jersey's general population has been around the four million mark, having shown marked growth in the previous three decades.

GENERAL POPULATION IN NEW JERSEY

1890 - 1940

Census year	General population	Increase over preceding census	
		Number	Per cent
1940	4,160,165	118,831	2.9%
