Linus Pauling Feels Vitamins May Be Mental Illness Cure

By Dustin Harvey

STANFORD (UPI) Chemist Linus Pauling, the only man to win two Nobel Prizes, is hard at work at the age of 69 researching the possibility that vitamins can help cure mental illness.

Pauling, who won the 1954 Nobel Prize in chemistry for his work on the structure of the protein molecule and the 1962 Nobel Peace Prize for present in the human body. championing the atomic test-ban treaty, has studied the molecular basis of mental illness for the past 15

years. The use of massive doses of vitamins - primarily vitamin B3, which also is known as niacin or nicotinic acid — in the treatment of schizophrenia was started 18 years ago in Canada.

The technique generally is called "megavitamin" therapy, although Pauling has coined his own label of "orthomolecular psychiatry." It usually is used along with other treatments for the mentally ill.

A small but enthusiastic group of doctors, mostly psychiatrists, uses the vitamin treatment, but the vast bulk of the psychiatric profession remains skeptical. Clinical studies are being made by several researchers in an effort to determine the technique's real value.

Pauling supported the theory in a scientific paper published two years ago. He contended most mental illness is genetic in nature and may result from low concentrations of vitamins and other chemicals in the brain.

"I believe that mental discaused by abnormal (chemi-might require large intakes
