Epoxide hydratase

This is probably familiar to you. But it just occurred to me that the differential induction of P450 of accompanying hydratase would ease the most troublesome accumulation of intermediates. I assume that the diols are relatively innocuous compared to the epoxides; but do not know of empirical validation.

Have you measured induction of hydratase in your own work?

P.S. - Please think who would be a good teammate for A.J. Enney.
