

Personal memo from
JOSHUA LEDERBERG

D P Clark
9/22/87

BuOH etc.

Thank you for clearing up the temperature interaction in foxicity: of interest in its own right.

How do your Br-ProH mutants relate to chloroacetaldehyde? Are these mutants hydrogenlyase deficient? to chloroacetate as an inhibitor? I scribbled a note to you about that in January.

BuOH-dependence!! The only remote analogy that occurs to me is streptomycin-dependence - and no explanation emerges from that!

At first blush, one thinks of membranes as site of foxicity and dependence. Is BuOH specifically incorporated?

Thank you for invites. When I lived in Madison I used to visit Carl Lindegren. Doubt that I can get away this year.
