Dear Doctor:

When can we expect a break thru on a cure or specific treatment for Multiple Sclerosis? Do we need more research in biomedical science, the study of body chemistry and functions? A doctor friend of mine claims the secret lies somewhere in the study of enzymes. Dr Julian Salk, one of the greatest of our time, says no major break thru before the year 2000.

Seems to me, that if we spent as much time and money on medical research as we do and have on the development of the atom bomb; much progress would have been made in the prevention and treatment of disease. A neighbor of mine whose wife is in the last stages of Multiple Sclerosis says I am fortunate that my loved one can still walk, and possibly treatment is forth coming in the near future.

Would you be kind enough to write me and tell me if any progress has been made in the treatment of M.S. and where I can write to Dr Julian Salk

Sincerely yours,

William J Ulcer
