TITLE OF PROJECT

Resource-Related Research - Computers in Chemistry

USE THIS SPACE TO ABSTRACT YOUR PROPOSED RESEARCH. OUTLINE OBJECTIVES AND METHODS. UNDERSCORE THE KEY WORDS (NOT TO EXCEED 10) IN YOUR ABSTRACT.

Our proposed research concerns computer-assisted structure elucidation of organic compounds of biological importance. We propose to make a quantum jump in both performance of existing and new programs and their availability to a nationwide community of biomedical scientists. We will build more powerful programs (basing our efforts on the solid foundation of programs developed under earlier grant support by: a) assembling a Semi-Automated Structure Elucidation System (SASES) which will act as a computer-based "laboratory" for carrying out experiments involving computer representation and manipulation of chemical structures, including structure elucidation, spectral data interpretation and prediction and conformational analysis to establish relationships between three-dimensional structures and their biological and chemical properties (structure/property relationships); b) developing at the heart of SASES the GENOA program, a method for structure Generation with Overlapping Atoms, which will include as a component our existing CONGEN program; c) developing a method for constrained generation of molecular conformations; and d) extending our topological structure representations to include both configurational and conformational stereochemistry and infusing proper treatment of stereochemistry throughout our computer programs. We will increase the availability of our programs to the outside community through resource sharing in the following ways: a) through a dedicated computer system which will exploit the proposed relationship of our work to the SUMEX-AIM computer resource; b) by continuing to develop exportable versions of our programs; and, c) by holding intensive workshops to introduce other research groups to our techniques.

Budget Remarks

Personnel

Professor Djerassi will continue in his role as principal investigator, providing overall scientific direction to the project, Dr. Smith acting as co-investigator. Drs. Smith, Nourse, Gray and Buchanan will be responsible for the design, implementation and application of the programs which we propose to develop, including representing the scientific interface to the outside community of collaborators.

Two programmers, Mr. Terry and a person to be appointed, will provide scientific programming support for the project including the following responsibilities. Mr. Terry will have primary responsibility for maintenance and documentation of application programs, with the assistance of other members of the scientific and technical staff. He will share responsibility for design and programming of new algorithms with the scientific staff. Together with the second programmer, he will provide technical support for collaborators and be responsible for developing versions of CONGEN and newer programs for other computer systems. The second programmer, to be named, will have primary responsibility for the dedicated computer system (the DEC VAX) requested in this proposal, including interfaces to the SUMEX PDP-10 system, and all other necessary system support functions including obtaining and implementing new languages, text editors and so forth.

The pre- and postdoctoral fellows supported by the grant will be involved in applications of the programs to chemical problems in our own laboratories or in research involving development of new computer techniques in collaboration with the professional staff.

The secretarial responsibilities (105 percent of a full time person) are distributed among three persons, reflecting our best estimates of actual time spent on this grant and other grants, to myself or Prof. Feigenbaum, which support the remainder of their salaries (Ms. Learned-Driscoll is supported for the remainder of her time by the Chemistry Department).

Equipment

A Dedicated Computer System - the DEC VAX-11/780

We have requested funds in the first year of the proposal to purchase a dedicated computer system for our project. The reasons for this approach are discussed in detail in Section A.2.c, Relationship to the SUMEX-AIM Resource, and in Section C.5.a. Briefly, the implementation of this machine as an adjunct to the SUMEX resource is a research study in itself, namely, how best to provide access to computational resources in a computing environment where heavy demands are being made on both development and application of software tools for solving biomedical problems. We intend to make the dedicated system available for production use of our applications programs, assuring high quality interactive service to our collaborators. We cannot get such additional capacity for this work from SUMEX which is already overcrowded and committed to new program development rather than production use. We will exploit our close relationship with SUMEX for the development of new programs, for continued close contact with the AI community centered there, as a gateway to communication facilities allowing remote terminal

access and for sharing of peripheral equipment and operations support so far as is possible. At the end of this section we comment on our situation were the dedicated machine not approved as part of this proposal.

In considering the type of machine which could provide the needed, additional capacity, we have focussed our attention on the qualities we would require in a machine, letting these considerations guide our choice. We require high quality, interactive service to support our programs in a reasonable way. An interactive program must provide rapid response to the scientist using it. This means we need a system with a good time—sharing operating system. Our programs tend to be larger than can fit comfortably on mini—computers, and certainly the more complex programs which we propose to develop will only grow larger. This requirement suggests a system which possesses a large address space, large enough that space is not a limiting factor. The combination of time sharing and large address space suggests a virtual memory machine with demand paging. Finally, we want a machine that will maximize long—term compatibilities with the SUMEX AI community and other biochemical and chemical computing resources and laboratory systems.

We have considered several alternative computers which might meet the above qualities and would provide the needed computational power to support our community. We have rejected all 16-bit (or fewer) mini-computers on the basis of address space limitations which are too restrictive for the size of our programs. Although it is possible in principle to fit our new programs such as the exportable version of CONGEN into such a small machine using extensive overlays, the programming effort would be prohibitive.

One plausible alternative is to purchase a computer compatible with the existing DEC-10 or DEC-20 systems at SUMEX and Rutgers on which our new software such as CONGEN will run without change. There are only two reasonable alternatives here, the DEC-20 family or the Foonly F-2 (a DEC-10 compatible machine being developed by a Bay-area company). The higher end of the DEC line is prohibitively expensive (e.g., the 2040 or 2050), leaving the DEC-2020 as the only reasonable choice. These systems have the advantage of running the highly developed interactive monitors (TENEX or TOPS-20) now used at SUMEX and other AI resources. This would maximize near-term compatibility and minimize operational costs. The 2020 (and the F-2) are computationally quite slow, however, particularly for arithmetic processing since they do not have a floating point processor. We expect our new research will make significant demands in this area.

There are several other negative factors about selecting either the 2020 or the F-2. The current price-performance index of the DEC-2020 is quite poor; no price advantage per user is achieved over the much more complex (and expensive) DEC-20's. Foonly is a very small company whose future is insecure. Only a few laboratories to which we might export software and collaborate on program developments and applications operate DEC-10 or -20 compatible machines. Finally, this class of machines is rapidly becoming obsolete. DEC appears to be directing their future developments toward VAX-like machines.

In parallel with this, the ARPANET AI community has been investigating long-term alternatives for INTERLISP support given the address space limitations of the DEC-10. A number of alternatives are under consideration including a "personal" LISP machine being developed at MIT, a PRIME system being considered by BB and N (Bolt Beranek and Newman Inc.) and the DEC-VAX. It appears that a consensus is developing around VAX given its attractive architecture, good interactive operating systems (UNIX or perhaps VMS) and vendor support. The DEC-VAX also appears to be

increasingly popular in scientific laboratories, including labs of several of our workshop attendees (see Annual Report, Appendix I). As another example, the National Resource for Computation in Chemistry will soon take delivery of a VAX system, meaning that additional, chemistry related software will soon become available on the VAX. (We note that similarly configured VAX's and 2020's have similar prices; the VAX will deliver considerably more computational power, however).

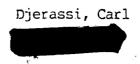

In summary, purchase of a 2020 or similar machine would be an expedient, short-term option to pursue in terms of our compatibility with ourselves. We feel strongly, however, that this would be short sighted. We must look further into the future in our proposal to make the best estimate possible on the trends in computer developments followed by both manufacturers and users. We are already seeing shifts in DEC, the AI community and, most importantly, computational chemists with whom we interact, toward VAX and similar machines. It is becoming clear that VAX or its equivalent is the machine to obtain, especially as a medium for providing high quality, interactive service to our collaborators, whether by network access to Stanford or programs exported to other sites. We have, therefore, tentatively decided to purchase a VAX as the dedicated machine to support applications of our programs. The configuration of the VAX as we propose it would include:

- 1) Basic system, including 512 KByte memory, one RP06 disc drive, one TE16 tape drive, VMS operating system, LA120 operator console, DZ-11A for eight terminal lines (\$185,000);
 - 2) 1 MByte additional memory (\$35,000);
- 3) Either 1 Mbyte additional memory (\$35,000) or one additional RP06 disc drive (\$34,000) (\$35,000 figured in the total appearing on the budget)
 - 4) FORTRAN compiler (\$3,300);
 - 5) Floating point accelerator (\$9,900).

Item (2) is strongly recommended by DEC in order to support more than two or three concurrent users. The choice in item (3) remains to be made. The tradeoff here is whether or not support for a larger complement of users (8-12) is best handled by a separate disc system for paging, or by additional memory. Further discussions with other VAX users will be required to reach a final conclusion. The final budget figure (\$254,214) was obtained by summing the above figures, taking an (\$254,214) percent educational discount and adding (8-1/2) percent California State sales tax.

We are currently evaluating the various operating systems available for the VAX, including VMS from DEC, UNIX from Bell Laboratories or the Interactive Systems Corp. UNIX version which couples both VMS and UNIX in one package. Choice of one of the non-DEC operating systems will add an additional increment to our budget. In addition, new software from DEC, such as new compilers, will represent additional costs. Given the price of the FORTRAN compiler, we can estimate other languages to cost about the same. We have requested funds in the budget to cover sortware purchases, with the greatest expense in year one.

We have also budgeted, as a one-time cost, our best estimates of the expense required to implement the SUMEX/VAX link (see Section C.5). This figure, \$15,000, will cover communications interfaces, circuit boards, cabling and integrated circuits.

As a final note, the rapidly changing situation with respect to new machines and cheaper prices for existing machines may allow us to reduce these estimates in the coming months. We are making every effort to find more cost-effective ways to meet our basic goals for the dedicated computer.

We believe that a DEC maintenance contract to support the hardware is the most cost-effective way to ensure maximum computer availability for our outside collaborators. Based on the hardware cited above and DEC's standard contract prices, the cost for year one (nine-month basis, three months covered under warranty) is \$13,450, including a maintenance contract on the existing GT40.

If this proposal is approved and funded without the proposed computer, we will be forced to provide access to our programs, for both development and applications, to SUMEX alone, i.e., perpetuate the current situation. Not only will an important experiment in resource access and resource sharing be lost, but our collaborators (see Section F) will become increasingly impatient at the slow response time of SUMEX. We know from past experience that if response time in a highly interactive program becomes too long, scientists will simply find more productive uses for their time and will cease to use the computer. It also must be recognized that, because SUMEX is funded separately from our grant, we must also try to ensure long-term computational support for our research. The machine configuration requested is, alone, insufficient to meet our needs in the absence of SUMEX, but would do so with augmentation (additional peripheral equipment, memory, network interface, additional terminal ports and perhaps additional personnel).

Graphics Terminals

The goals of our proposed research are heavily involved with stereochemical representations of molecular structure. The requirements for visualizing these structures plus our desires to seek improvements in the interactive capabilities of our programs (most of our collaborators have requested some form of graphic input and output) have led us to propose a low-cost alternative to expensive graphics systems (Evans and Sutherland, Vector-General) or even expensive graphics terminals like the DEC GT-40. We are currently examining alternative display systems which represent new technology and provide graphics capabilities together in some instances with capabilities for input of graphic (in our case structural) information.

We have examined several display systems so far, including those manufactured by Grinnel Systems (Santa Clara, CA), DeAnza Systems (Santa Clara, CA) and Tektronix. At this time, the Tektronix 4025 appears to have a better set of desirable features, including capacity for pseudo-rotation of structures based on sequential display of stored images, programmable functions for special graphics such as automatic construction of ring systems, and cursor control for structure input. The budget figure requested includes the basic terminal plus additional display and graphics memory (to a total of 32K and 64K bytes, respectively) to allow storage of sufficient multiple images for pseudo-rotation (to add three-dimensional characteristics to the visualized structures). We will continue to search for other low-cost graphics terminal which would meet our needs together with the needs of our collaborators.

A second terminal has been requested in the second year of the budget. By that time we should be heavily involved in representation and manipulation of three-dimensional representations of structure and would require additional graphics terminal support for program development and application.

Author or co-author of six books (four dealing with organic mass spectrometry) and over 930 scientific publications. The most recent publications (since January 1978) are listed here, with papers Nos. 927, 925, 924, 915, 907 and 906 being particularly relevant to this application.

MIH 398 (FORMERLY PHS 398)

Rev. 1/73

RESEARCH SUPPORT: CARL DJERASSI

Since essentially all of my research is supported by the NIH, it is important for the reviewers to understand what each grant actually covers in terms of personnel, equipment, etc., and how the present renewal application of RR-00612 fits into this overall picture. Therefore, I am going into somewhat more detail than is generally required for this section.

GM-06840 (20-23): "Marine Chemistry with Special Emphasis on Steroids" 5/1/78 - 4/30/82. Current annual budget \$133,042. This grant supports the bulk (equivalent to three predoctorate and five postdoctorate fellows) of my collaborators who are working on the isolation, structure elucidation, biosynthesis and possible biological function of marine steroids.

GM-20276 (05): "Magnetic Circular Dichroism of Cytochromes P-450" 7/1/78 - 6/30/79. Current budget \$38,201. Aside from equipment maintenance and liquid helium, this grant supports partial salaries of two postdoctorate research associates. A renewal application, entitled "MCD of Porphyrins and Artificial Heme Proteins" has been submitted.

RR-00612 (09-10): "Resource Related Research - Computers in Chemistry" 5/1/78 - 4/30/80. Current budget \$144,051 (5/1/79 - 11/30/79). The current application is for renewal of this project. The renewal represents a significant change in emphasis from the current proposal in that the SUMEX-AIM computer resource is the resource to which our research will be related in the future, rather than the mass spectrometry laboratory. For this reason, the following two (partially overlapping) applications were submitted (and are pending) for support of personnel and supplies and purchase of new equipment to maintain and upgrade the mass spectrometry laboratory. Because of this shift in emphasis, the current proposal requests no funds for support of the laboratory and does not overlap in any way with the following two proposals.

AM-04257: "Mass Spectrometry in Organic and Biochemistry" 12/1/76 - 11/30/79. Current annual budget \$74,800. This grant currently supports one mass spectrometer, a senior technician to operate the instrument, one postdoctoral fellow and three predoctoral fellows, who are engaged in isolation and synthetic work related to interpretation of fragmentation patterns of known and unknown molecular structures.

A renewal application has been submitted for this grant and is currently pending. This renewal is designed to support the mass spectrometer, personnel and supplies currently supported under RR-00612. In addition funds were requested to upgrade the mass spectrometer facilities. No action has as yet been taken on this application.

Pending Application: A NIGMS Shared Instrumentation Resource proposal entitled "A Shared Mass Spectrometry Resource" has been submitted for the period 9/1/79 to 8/30/82. The first year budget is \$145,046, including \$130,850 of capital equipment. This proposal requests support for equipment similar to that requested in the renewal of AM-04257, with some differences reflecting the resource sharing aspects of the NIGMS program. The only personnel for whom support is requested under this proposal include 10 percent of Dr. Smith and 10 percent of a senior technicial. No action has yet been taken on this application. If AM-04257 is approved then only \$18,500 is requested from NIGMS for a chemical ionization accessory.

RESEARCH SUPPORT: CARL DJERASSI (continued)

Pending Application: An application entitled "Circular Dichroism of Cyclic Ketones - Conformational Isotope Effects" with an annual budget of \$55,782 for the period 4/1/79 to 3/31/81 has been submitted to the National Science Foundation. In terms of personnel, it covers the salaries of one postdoctorate and two predoctorate fellows for synthetic work on chiral ketones, whose chirality is only due to ¹³C or deuterium. No action has as yet been taken on this application.

917. Determination of the Absolute Configuration of Stelliferasterol and Strongylosterol - Two Marine Sterols with "Extended" Side Chains.

Tetrahedron Letters, 4369 (1978) by N. Theobald and C. Djerassi

918. Minor and Trace Sterols in Marine Invertebrates IX.

Verongulasterol – a Marine Sterol with a Novel Side Chain

Alkylation Pattern.

Tetrahedron Letters, 4373 (1978)
by W.C.M.C. Kokke, W. H. Fenical, C. S. Pak
and C. Djerassi

919. Optical Rotatory Dispersion Studies CXXVI. Synthesis and Chiroptical Properties of Cyclohexanones with Chirality Solely Due to Isotopic Substitution: 12CH3 vs 13CH3 and CH3 vs CD3

Tetrahedron Letters, 4377 (1978) by C. S. Pak and C. Djerassi

920. Isolation and Structure of 26,27-Cycloaplysterol (Petrosterol): A Cyclopropane-Containing Marine Sterol.

Tetrahedron Letters, 4379 (1978)
by B. N. Ravi, W.C.M.C. Kokke, C. Delseth and
C. Djerassi

- 921. Minor and Trace Sterols in Marine Invertebrates VIII. Isolation, Structure Elucidation and Partial Synthesis of Two Novel C₃₀ Marine Sterols Stelliferasterol and Isostelliferasterol.
 - J. Amer. Chem. Soc., 100, 7677 (1978) by N. Theobald, R.J. Wells and C. Djerassi
- 922. Optical Rotatory Dispersion Studies CXXV. Independent Evidence for Preference of Axial Deuterium vs. Axial Hydrogen through Variable Temperature Circular Dichroism Spectra of (4S)-2,2-dimethyl-4-deuteriocyclohexanone and (3S)-3-deuterio-4,4-dimethylcyclohexanone.

J. Amer. Chem. Soc., 100, 8010 (1978) by S.F. Lee, G. Barth and C. Djerassi

923. Partial Reduction of Aquomethemoglobin on a Sephadex G-25 Column as Detected by Magnetic Circular Dichroism Spectroscopy and Revised Extinction Coefficients for Aquomethemoglobin.

> Analytical Biochemistry, 90, 474 (1978) by R. E. Linder, R. Records, G. Barth, E. Bunnenberg, C. Djerassi, B. E. Hedlund, A. Rosenberg, E. S. Benson, L. Seamans and A. Moscowitz

924. Minor and Trace Sterols in Marine Invertebrates VI.
Occurrence and Possible Origins of Sterols Possessing
Unusually Short Hydrocarbon Side Chains

Bioorganic Chemistry, 7, 453 (1978) by R.M.K. Carlson, S. Popov, I. Massey, C. Delseth, E. Ayanoglu, T.H. Varkony and C. Djerassi

- 925. A Novel Role of Computers in the Natural Products Field.

 Naturwissenschaften, 66, 9 (1979)

 by C. Djerassi, D. H. Smith and T. H. Varkony
- 926. The Synthesis of Demethylgorgosterol.

 Tetrahedron Letters, 767 (1979)

 by R. D. Walkup, G. D. Anderson and C. Djerassi
- 927. Applications of Artificial Intelligence for Chemical Inference XXIX. Exhaustive Generation of Stereoisomers for Structure Elucidation.
 - J. Amer. Chem. Soc., 101, 1216 (1979) by J. G. Nourse, R. E. Carhart, D. H. Smith and C. Djerassi
- 928. Minor and Trace Sterols in Marine Invertebrates XI. 5α-24-Norcholestan-3β-ol and (24Z)-Stigmasta-5,7,24(28)-trien-3β-ol, Two New Marine Sterols from the Pacific Sponges Terpios Zeteki and Dysidea Herbacea.

Helv. Chim. Acta, 62, 101 (1979) by C. Delseth, L. Tolela, P.J. Scheuer, R.J. Wells and C. Djerassi

BIOGRAPHICAL SKETCH

(Give the following information for all professional personnel listed on page 3, beginning with the Principal Investigator. Use continuation pages and follow the same general format for each person I

NAME	TITLE	BIRTHDATE (Ma. Day, Yr.)
Dennis H. Smith	Research Associate	11-12-42

Applications of Computers to Chemistry

RESEARCH AND/OR PROFESSIONAL EXPERIENCE (Starting with present position, <u>list training</u> and experience relevant to area of project. List all or most representative publications. Do not exceed 3 pages for each individual,)

Science Research Council/NATO research fellow. Development of programs for structure generation and analysis including new approaches to the processing of high and low resolution mass spectral data and to handling magnetic resonance data. Stanford University, 1977–1979.

Junior Research Fellowship at King's College. Work on various computer-assisted approaches to chemical structure elucidation including both rule-based and pattern-recognition methods. Part of this work being incorporated into a Ph.D. thesis for the Computer Science Department. University of Cambridge, 1973–1977.

Research Assistant in Professor Eglinton's Organic Geochemistry Unit in the School of Chemistry on an OSTI-grant (Office for Scientific and Technical Information). Design and implementation of file-search and interpretive schemes for processing low-resolution mass spectral data, work on data-communications software and creation of small, dedicated data-acquisition system on PDP-8 mini-computers. University of Bristol, 1971-1973.

M.Sc. thesis on limitations of CNDO-type semi-empirical quantum mechanical calculations. University of Cambridge, 1968–1970.
