Streptomycin and streptothricin

March 27, 1952.

Test (cross-bunch) Sm^R and Sm^S strains vs. old streptothricin 10^4/ml. W1922, W1607, W1177, 58-161, W677 all Sth^S
Lack showed a more ~~gradual~~ abrupt cutoff in streaks. Cf. previous observations of SM-STH cross-resistance != These concerned cross-resistance at low levels only! ($S_{u\,sm} \doteq 10u$ sth).

3/29. Selections for Sth^R:
W1678, W1177 ca. 10^9 ea + 10,000 u STH. No survivors

4/20 ff. Add 10 ml grown culture 58-161 to 100 ml Penassay + 50 u/ml STH. After 4 days streak and test survivors.
all tested were STH^R SM^S. Picks 1 as W1969. When cross-bunched against lawnful of 1000 u/ml, show slight inhibition, whereas 58-161 is completely inhibited. Sth^R may differ from S^R in step-resistance.

Trial run: λ adsorption assay with millipore filter

8/13 ± 152

λ (1439 Iwoffate) diluted to nominal 2×10^6/ml.
W1655 young aer culture in NSB, nominally 2×10^9/ml.

Mix in equal volumes 5+5 $4^{50} - 5^{15}$ 37° Incub. (no aer.)

(A) Assay initial phage ~~(adsorbed to unadsorbed)~~ Dilute 1:100 and filter (uncorrected for 1:1 dilution)
with W1655. (132, 181) $= 1.6 \times 10^6$

(B) Assay filtrate .1 543 .01 42 .53 ~~.543~~ $\times 10^4$

(C) Assay residue λ and bacteria (173 .1) (25 .01) Bacteria: $.143 \times 10^7 = \frac{14}{96}$ %
λ: $.173 \times 10^4$

(D) Assay diluted mixture. .1 >1000

λ	165, 162	1.64×10^4	Expt completed 5:38
Bacteria		$.96 \times 10^7$	

Initial λ ≐ $1.6 \times 10^6 \times \frac{1}{2} \times \frac{1}{100} = .8 \times 10^4$
λ in mixture = 1.6×10^4
Residue λ = $.17 \times 10^4 \times \frac{96}{14} = 1.16 \times 10^4$
Filtrate λ $.54 \times 10^4$

Low e.o.p for λ, measured by uninfected cells?

March 28, 1952.

~~Confirmation~~ Test of Mal- elimination in Hfr crosses.

Streak out cross-mixture on EMS lac. Scoring difficult – ? ca 10% Mal+ 30% Lac+

Pick small lac+, look for lac v

3/31/52. EMB Medium rather poor: characterization doubtful. 5 ? / 24. Restreak

A. Recheck from EMS lac. #1-5

Repeat 40 addtl. test from cross plate 1? #6

		lac	Mal
1		v	—
2		v	—
3		v	—
4		v ?	—
5	X	—	—
6		+	+

~~Save + ↓~~ → T.O. 6/53.

Note 6/52. Unless these are homozygous, which is unlikely, elimination likewise occurs in Hfr x Het. The important point is not readily tested here, namely whether markers such as Xyl or Mtl + in W1177 would be heterozygous. Selection for prototrophy invalidates search for TL, M heterozygosity which would be nearly as useful! Similar cross should be conducted on EMB lac sen.

March 30, 1952

Lac+ S^R had been noted repeatedly in mixtures of W1895 and W1607, etc. These might represent recombinants.
Grow W1895, W1177, W1607 overnight in broth. Mix 1 ml each + 10 ml Pennassay. Incubate 11^{30} AM – 4 PM. Streak out on EMB lac sm.

are sm-inactivated Hfr cells participating?

1895 no colonies
1607 all –
1177

1895 + W1177 ca 1–2% Lac+ S^R some apparently sectored
1895 + W1607 " " " , but Lac+ very weak (Gal – ?)
R → Lac+ Mal Xyl – S^R Aux.

3/31. 1:5 each 12 N.
A. 2 PM EMBlac: clumping not obvious. EMBlac sm 2+ 37–
well cool. streak out.
B 5 PM. EMBMal sm. 1 Mal+ ca 500 – (streak)

Exp. Time seg; Time by dilution in broth, & time of disappearance of lacV re lac+.

K: Lac+ and − ... all are Mal−, Xyl−.
(3 are V_1^R selectants)

Among Lac+, $10 V_1^S / 17 V_1^R$

Lac−, $1 V_1^S / 19 V_1^R$ (coupled with Lac+ V_1^S).

a) Keep this pair for test (#32)

b) Test all for prototrophy (B, agar).

3/-8 Lac+ } grew on B, agar. both are B_1 −.
2-10 Lac+ }

∴ 2 B_1 − +++ of 47 recombinants (ca ½ Lac+ S^R).

3.2 Lac+ $V_1^S S^R$ Lac− $V_1^S S^R$ sci

both are T− B_1 − L+

In most tests, T− and L− are not distinguished (on replica plates), but only on recheck in tubes. L+ V_1^S may be associated.

4/2/52

C The pure lac+ S^R are especially significant as they exclude the possibility that residual Hfr cells fuselage W1177 microcolonies on the agars (after agglutination and clumping).

C2 - pure lac+ Restreak: 6 ✓ lac+ pure. Pick for Mal, V, test.
C3 - sectored lac+/-

C1. 5: Repl to EMB lac, Incom for suit. lac/S mean.

4/4/52 C2-3. (lac+) all Mal-. C2: $3V,^R$ $3V,^S$

C3: $7V,^R$ 5 S
+5 +5
13^R 13^S

C1 in each are, isolated lac+ S^R identified, fewer no lac+ S^S! ∴ the small sectored colonies presumably are related to Hfr recombination.

928 A) Repicks 8 lac v? colonies:

1	−, v,	+

Summary.

A) Lac + I −
B) Lac + S^R I −
} Almost all TL− M+ S^R Mal− Xyl− Mtl−. Segregating Lac − V_1 − V_6 in more or less linked pattern. (V_6 − Lac − TL−). Also upheld in C.

C) Prototrophs! → B_1− > B_1+. ca 10:1.

In Hfr x F− there appears to be a constraint favoring TL− ... as well as S^R Mal− M+ .... [Rothfels crossed S^R M− x S^S M+ ... Almost all recombinants in his experiments were also T−L−Lac−V_1^R just as here! This was concluded to be based on the M+ .. Lac− ... linkage. It can be reinterpreted as a Lac ... TL ... Y linkage, with Y a hidden selector. But, the order V_6 Lac V_1 TL Y would (if applicable to Rothfels) would give a different sets of auxotroph single crossovers! The conditions of mating do not preclude a limited degree of F+ − transduction.

It may be conclude that selection for TL+ essentially discounts the effect of Y over the Lac − TL region, but leaves this influence at the left end, so that all of this set of prototrophs are Mal−.

① Further Project: Compare Hfr x F+ crosses.

② Study T−L−V_1 more closely

110/32

Weighted average: 110/32 ca .3 lac+!

Of 32 pairs, only 3 had Mal+ : 20−
22+
31−

As EMS Mal B$_1$, a much larger proportion appear to be Mal+

11 EMS lac B$_1$, colonies picked to EMS Mal B$_1$: ca 30% +

Effect of EMS medium??

W1895 × W1956
various conditions

April 23, 1952.

B. Unaerated. 5½ hr cultures. Mix 2 hours   ca 5%?
A. Aerate " " (s aeration).

A1 —
A2 heat 60° 5 minutes. Plate 10×.   No kill!
A3 UV 0, 10, 20, 30 sec. on plate
A4 Partially sediment (ca 90%) mixture. Sediment ail. 20+/268
A5 ↓ Supernatant dil. 6+/264.
A5 appears superficially somewhat less. Should be repeated.

A3): 0 Mean plate counts. 22+/350 21/363
10 "
20 "
30 ca 30% surv. 5/184 14/280.

slight effect?

4/24/52.

C. Aerate overnight W1895, W1956TZ. Remove (c air) 10 AM.
Mix and regrow 2 PM.

		EMB lac sm. (Poor est. of counts)	Total counts:
1. 1 ml ea parent / 10 ml Penassay.	Air	3, 6 (+, ±)	40, 34
2. W1956 control	"		
3. .1 ml ea par.	No air	0	40
4. .01 " "	"	6	129

Confirms very high relative rate of recombination in diluted mixtures.

1 C1 (stars) 3 38
2, 3 C2 plate mixture to 5 PM (grow on plate) before fix. 3 heavily overgrown.
" "

4/25/52

D. 1895, 1956Tz from overn. acc. 10AM - 2PM Region.
Mix ca 5ml each + 5ml Tenassay 2PM — 3PM EMB Lac sen.

1	(+ 90 mins room temp.)	< 1/5% lact+
2	supernatant after strong centrif.	"
3	Resuspend in saline. Re-sediment : supn't.	"

cultures may have deteriorated or undiluted added. contact.

E ~~Mix~~ Dilute 1:100 3PM. Mix in 10ml: (assume 10^{10}/ml initial)

1	1ml ea	(ca 10^8/ml)	ca 1/2% lact SR.
2	.1ml each	(ca 10^6/ml)	" "
3.	.01 ml "	(ca 10^5/ml)	0

In view of D these results are meaningful. However, the development of zygotes at extremely low dilutions is confirmed. [Competition expts?]

Flagellar phages: Salmonella

~~944~~ 942

April 24, 1952

Received this date from Boulgakov

1 "Steam" 372 = ~~H901~~ Sutii - Boulgakov Rough
2 377 H901
3 383 = Felix 6.396 V/3

A & VIII - 113 1936 § had been propagated on H901.
B " "
C " Passage 372
D " " "

3/24. Open 1, 2, 3, A. Test by cross-streak on EMBLac

	A
1	S
2	S
3	S (later secondary R)
Stanley	R
O-901	S!
LT-2	R
LT-22	R

3/25.

	A	B	C	D
H901	S++	S ++	S +	S +
O901	S+	S ++	R	R

Apparently C and D fit description of flagellotropic phage. Should be single-plaqued to verify effect of propagation on H901, supposedly the sole destruction of A+B.

Test various Salmonella types on EMBLac vs. C.

1+C cleared after ca 3 hours in Ramsay. Streak out for O/S survivors

Restreak 1+C, 2+C. Pick single colonies: restreak; test motility.

1: 3 MS most promising ← like (#1 →). Retest single colony isolates.

2: 3 motile, 1,2,4 re tested: show limited motility overnight. Retest single colony isolates 1PM – 9AM to 10PM (from #1)

H901 controls! — clump of large bodies seen in soft agar!

Motility of H901, & motility of O901 verified microscopically. (over)

O-forms from S. typhi ste.

942-2-1 4 colonies tested. #1 did not migrate overnight
#4 ++
↓ should be unstable

942-1-4 " " #2 +
#4 +++

Compare motile + non-motile "revts" for sensitivity to φC

---

check phages 942-1 942-2
alike ↓

H901 S (mucoid) [culture old, from liquid]
0901 R
3 motile revts of H901/C } S +++ [from mobility agar]

1 NM-H901 R. save.

			A φ	C φ
1		1	S	P
2		2	S	P

20		SY 79		

phage C.

	LT2	marked S
SW	519	S ±
SW	520	S +
SY	79	marked S.

Lig growth with C → motile

Inoculate from lytic area to Peressay 10+ AM.

3PM: para B + φA Motile
para B + φC NonMotile → 3/3 bimotile for 8 hours
stanley + φC NonMotile → 1/3 " " " (#1)
LT2 + φC Motile! Recip LT2 + φC also unmarked motile.

phase?

4/28/ Grow 1 plaque of φC on #1. = φ 942-1 } (Peressay 50 ml)
" " #2 = φ 942-2 } behave alike re H, 0901 contra A, C as rec'd!

Responses of SW519, SY79... phase variation? UV variation?

Replicas of A to EMBlac sm; EMB Mtl.

1. of 31 Lac+, 5 were S^R
2. No Mtl+ Lac were seen in 5 plates (ca. 1000 Lac- Mtl-
   31 Lac+ Mtl±)

Owing to disturbed ratio of Lac+ : Lac-
and overall low number (5) of recombinants
this experiment is not conclusive

Bordgalsov flagellotypic phage 942

Summary.

4/29/52.

1. Two phages (A-B) (C-D) received from Bordgalsov.
2. AB is essentially a typhi (also paratyphi B) phage, but independent of somatic (842-1 Rough) or Vi antigen.
3. C-D Accords to description of flagellotypic phage. High (?) titre obtained from single plaques either on H901 (942-2 φ) or Sutic Rough (942-1φ) S. typhi. This acts on H⊕ Typhi, probably mutant on Vi+ (Ty 2V, SV79) It has given non-motile secondary growth and O-forms of various stability with S. typhi (Sutic R unstable; H901 "stable"), para B and Stanley. Although washed lysis is seen with typhi murium LT2 and SW519 (typhi; i —), secondary growth remained motile (Vi, V antigens ??)
4. Motile "mutants" from S. typhi became again sensitive to φC.
5. Saved for further work: NM typhi H901 (para B; Stanley. Should be subcloned. Also lysates from single plaques.
6. L-forms not of motility agar. See 944

10/31 - which para B? Stock book records SW533 (=703) but no explicit notation here

4/28/52.

W1895 + W1956 TZ. Overn. aerate 9:30 to 2:45. 17y to 4y5

				lac sm	lac
	A	1	1	21+, 379-	ca =+,-
	B	1	.01	4-	
*	C	.01	1	3+..;	28 lac+, >-
	D	.01	.01	1+ 22-	68+, 17-, 3s

plate on EMB lac ± sm.
Again note relatively high efficiency of diluted crosses (esp Hfr << F-).

4/29/52.

1895 TZ + W1956. Aerate overnight. No aer 3h. (TZ). 1:10... (no shaking incubation) inocula

				lac sm.	in 10 ml. 2PM...
A	1	+	1	0	!
B	.1		"	0	
C	.01		"	0	
D	.001		"	0	

5/1/52. No aer overnight. 1:10 Pen aerate 10AM - 2PM. Suspend air ca 30 minutes to reduce TZ

Incor 1 or .01 ml/10. No air. 2-4:30

	1895 TZ	1956	EMB Lac	
A	1	1	ca 20-:1+	!! (lac+ fail to grow in central broth?)
B	.1	1	lac+ v. infrequent	only 1 lac+ in several EMB Lac: Lac s.
C	.01	1		
D	.01	.01	only lac- seen.	

rate → 100% of Hfr cells

Replica A to EMB Mfl EMB sm.
← (see over)

~~S. typhi H901~~ large bodies

942C.
944

4/27 Many colonies of ~~large~~ L-type growth noticed in course of motility tests in H901 controls.

H901 was inoculated from EMB plate (?) to semisolid agar incubated ca 24 hours. Room temperature 8 hours.
Inoculate to semi solid agar (5 ml ±) + 500 units penicillin.

4/28. – penicillin showed same interspersal of bacilli and spherules
+ " " no macroscopic growth; spherules were prominent.
These are very transparent, practically invisible except to phase microscopy possibly accounting for infrequency of reports on them.

Similar admixtures of spherules noted to varying extent in semisolid agar smears of S. Stanley, pearB, and 842-1 eswells cytotes of H901!
(Test LT2, K12...).

4/29. — Similar observations without & with penicillin. However the L-colonies are much less prevalent than in H901.
W1895 and W1956 unequivocal in motility agar. Then transfer to nut agar + penicillin 500 u/ml. Occasional L-type, usually not colonial, seen with and without bacteria respectively. Small + very large spheres seen
5/1 Similar structures with B. subtilis and staph. aureus.
Further control examinations showed similar spherules singularly in uninoculated plates, also in freshly poured medium! Doubtful connection with bacteria!

May 3, 1952.

See 938

W1895 x W1876. Grow overnight Penassay. Mix 12N 1ml 1/10 ml each. Incubate to 1 30.

A. EMB Lac 9 plates ca. 100/plate. 2?? lac ±

B. EMB Lac sm ('10 and "100x). B·2. O+; B':2 O+ B" 3: 3+?

C. EMB Mal sm (1 and 10x)

D. D(B,)

C: 78- 7+ / 75- 8+! / 43- 9+ Contrast very low frequency of lac+ S^R. These Mal+ S^R appear to be unselected. Possibility of contamination in parents? 196- 24+ → all lac-.

W1895/1938 "control" - Lac EMB sm. 94-: 6+. Conditions are suitable. Cf 938D which shows similar patterns.

5/4/52. ~~Repeat C and also plate on EMB Mal.~~ Replica A to EMB Mal. As above. Reinoculate ca 5 hours Mix 3 45 - 6 45.

1895 + 1876

E EMB Mal "W1876" streaked out gives 10% Mal+ on EMB Mal sm.

F EMB Mal sm

G EMB Mtl These expts n.g. except rare lac+ S^R

H 1895+1956. Spread on D(B,) 3 45. Incubate to 7 PM. Examine under phase microscope Numerous microcolonies. About 1/100 is partly or fully lysed with many granules of various sizes (such as mentioned by Pogt?) Need controls!
