Dr. Josh Lederberg 1230 York Avenue New York, NY 10021-6399

Dear Dr. Lederberg,

Thank you for your note and your interest in our article on \underline{E} , \underline{coli} hemolysins.

I must apologize for not being aware of your observations on the hemolytic effect of \underline{E} . \underline{coli} lysates and the work by Schiff and Bornstein on typhoid cultures.

Lysis by osmotic shock or sonication does release an intracellular form of hemolysin and a form bound to cell membranes (B-or cell bound hemolysin). These hemolysins appear to be precursors of the γ or extracellular hemolysin. We have a monoclonal antibody to the hemolysin which could identify the mechanism of lysis.

Respectfully,

Irvin S. Snyder, Ph.D. Professor & Chairman
