

December 12, 1949.

Dr. Aaron Novick,  
6200 Drexel Ave.,  
Chicago 37, Ill.

Dear Aaron:

We will be coming down Sunday afternoon, by car or train depending on the weather, arriving about 5 - 6 PM.

How long we expect to stay will depend on the duration of the meetings. If they are not concluded by about Tuesday noon, I will probably have to stay over Tuesday night, through Wednesday.

I've been starting to go into some radiobiological work myself, with a study of the UV responses of the diploid strains. The most surprising result, perhaps, is that there is no marked difference in the crude experiments already done, but this probably means that the total mean genome count per cell is not far apart in the multinucleate diploid and the (more?) multinucleate haploid cells.

See you soon-

Joshua Lederberg
