

Dear Josh,
I once did consider the question of using the chemostat
to observe increase in prototrophs. Unfortunately we
can only maintain one strain in the chemostat - unless
there is really little difference in their growth rates.
But I'm sure that with a little effort one could find
strains that could be maintained with no
rapid change in time in their relative frequency in
the chemostat. We ought to talk about this.

Jane and I are off to Jamaica Saturday for
two weeks. Shall we bring back some Jamaican
colic + pl. yes for you? - did you get your electronic
gear yet?

Regards to Esther

Aaron
