Dear Josh -

Thanks for letting me see this and the SCITEL proposal. I'll keep the latter, unless you need it.

Neurochemistry can be indeed fascinating and no doubt the time is ripe for a direct chemical attack. That an engram is an alteration of the protein in a way other than the amino acid sequence is appealing, since nerve cells don't seem to have to replicate.

To me the most novel idea of SCITEL is the daily newspaper; in a tabloid form it could replace the Daily News or Mirror. It could be arranged for maximum efficiency of clipping and for most articles could serve as the only way the reader sees it.

It was good seeing you again. I forgot to say that I had a nice visit with Seymour at Brown a couple of weeks ago.

Jim
