January 6, 1951.

Dr. Joshua Lederberg  
Associate Professor of Genetics  
University of Wisconsin  
Madison 6, Wisconsin.

Dear Dr. Lederberg:

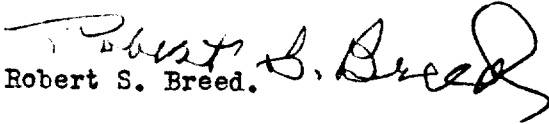

We are always interested in comments on the text of the Bergey Manual, and thank you for your letter of December 30th. I am forwarding this to Dr. F. O. Holmes of the Rockefeller Institute in New York City.

I have read Dr. Cowles paper and find a statement in it that seems to be in entire harmony with the text of the Manual. In the days when this work was done, the finding of phages that affected spore formers did give a method of testing heat survival that could not be made on non-sporeforming bacteria with the same ease. This phage was used as a test organism.

I note too, your preference for numbering systems for phages. As one of the uninitiated I find it very difficult to get an intelligent understanding of papers using various systems of numbering without an undue amount of work. I have not been surprised that the majority of plant pathologists reported to Dr. Black last year that they preferred the use of the binomial system to the numbering system.

With best wishes,

Sincerely yours

  
Robert S. Breed.
