

November 3, 1950.

Dear Robinow:

I promised to send you our first prints of haploid and diploid coli. Our camera equipment arrived last week, and we managed to run off the accompanying, photographically incompetent prints (Bad ferratype plate and uneven development of negative). We are not quite adequately set up, but should be in a few days. However, the enclosed ~~mf~~ should illustrate the differences we consistently find between $2n$ and $1n$ cultures. If you have run across *E. coli* looking like our $2n$, I should be glad to hear about it.

Sincerely,

Joshua Lederberg,
Associate Professor of Genetics
