#### INAUGURAL DISSERTATION

AN

#### ON THE

### APOPLEXY.

WHEN we take a retrospective view of the different fystems of physic, which have made their appearance in different ages and countries; likewife, the difcordant opinions respecting the caufes and cure of difeafes : we have just reafon to lament the contracted state of human knowledge in general, and more particularly the abstrue nature of the science of medicine. Beçause, I am pretty clearly convinced in my own mind, that as much harm as well as good, has been committed by those who have undertaken to practice this art among mankind, on fuch principles and theories, as have been handed down to them at particular periods of time; principles and theories which were evidently built on hypothetical conjectures.

FULLY imprefied with an idea of fo great importance, I fhall enter on my fubject with diffidence: and if any doctrines or opinions fhould be advanced in the following effay, not corresponding with former experience and observation; or that do not meet the approbation of the *candid* and *liberal*, I shall most certainly, with the greatest cheerfulness discard them as imaginary and not well grounded, for those which are allowed to be founded on a more substantial basis:—for the only rational and proper method to become versant in useful knowledge, is to hear the *fentiments* of others, and be open to *canviction*.

PREVIOUS to entering on a discussion of the difeafe, which is intended for this Inaugural Differtation, it may not be entirely improper to point out its original derivation :- Apoplexy is then derived from the Greek word anonneoso, which in that language fignifies to ftrike, or knock down, or fmite fuddenly :--Latin authors have confidered the fame difeafe under different appellations :--viz, Sideratio, Attonitus Morbus, Attonitus Stu-por, &c. But I shall for the fake of perspicuity and concifeness, make use of the term apoplexy throughout the whole of the following effay; as multiplying names, has only a tendency to confuse, and make our ideas of no determinate fignification. This is a practice, it is prefumable, should be purfued particularly by every perfon, who attempts to inveftigate any part or the whole of the human economy; either with a view to enlarge his knowledge, or to understand in an accurate manner, the healthy or morbid functions of the animal body; fo that he might be capable of difcharging the duties of his profession, with that honor and dignity the fcience of medicine juftly merits.

IT has been a univerfal practice from the time of Hippocrates to the prefent day, to diffinguish difeases into different genera and species; and even the fame difease is very frequently confidered in the latter point of view. Thus the difease under our present confideration has been divided by medical authors into feveral species, viz. fanguineous, serous, spasmodic, symptomatic, &c. Doctor Cullen in his methodical nosology, enumerates nine species, befides those which are symptomatic.

Most writers and practical phyficians have taken notice of two kinds of apoplexy, namely the fanguineous and ferous. There is no manner of doubt, but effusions of blood or ferum do frequently happen in the head; though these are certainly to be confidered as effects and not as caufes; therefore it will be proper to feek for the caule of the difease from some other source, and it will be found to confift in an unequal excitement of the arterial and nervous fystems. Dr. Rush in his clinical lectures, divides apoplexy into the tonic and atonic ftates, and confiders it as a difeafe of the wholefyftem, as much fo as confumption or dropfy-and depending either on direct or indirect debility. Let us fuppose for the fake of argument, that there is fome foundation for the diffinction of fanguineous and ferous apoplexy; yet notwithstanding, it is my opinion, it would be a difficult matter to diftinguish one from the other before the death of the patient: for the following reasons-1st. Because, the fymptoms in both are the fame or very analogous. 2d. Because, effusions of blood frequently take place, in old perfons who are far advanced in years; while on the other hand, ferous effusions

B 2

take place in young perfons, and in thofe who are in the prime and vigor of life. Thefe principles being admitted as true, and I truft no one will pretend to deny them, as being uncontrovertable facts; this important principle then ought naturally to prefent itfelf, to the mind of every phyfician, who takes into his hands the life of his fellow creatures; That he fhould molt inevitably prefcribe remedies according to the ftate of the body, and the moft urgent fymptoms, and not (as is too frequently the cafe) for the name of a difeafe, which may probably be arbitrary, and of no definite fignification,

THIS is also the opinion of one of the American physicians. He observes in his nosological and pathological lectures, and at the fame time endeavours to impress on the mind of every fludent in the most energetic language, that every prudent and fensible physician will prescribe remedies according to the " condition of the fystem, and not for the name of a difease."

### DEFINITION.

DOCTOR CULLEN, whole authority and name, ftood as high as any in medicine; obferves in his first lines of the practice of physic, That "apo-"plexy is that difease in which the whole of the "external and internal, and the whole of the "voluntary motions, are in some degree abolish-"ed; while respiration and the action of the heart "continue to be performed." This definition appeared to me so comprehensive and explanatory of the difease, that I chose to quote the Doctor's own words and expressions on the subject.

### HISTORY OF THE DISEASE.

THIS difeafe like many others to which the human body is incident, fpares neither fex; for I believe it as generally feizes the female as the male: no conftitution or age can be faid to be entirely exempted from becoming affected with this direful malady: it even attacks perfons in youth, in middle life, and in declining years ;—though the latter period is fuppofed to be the most frequent. It is afferted that apoplexy most commonly effects those perfons who are far advanced in life, and particularly those above fixty years of age.\*

AUTHORS confider predifposition, (or to fpeak in more intelligible language,) a particular state of the body, either as it respects its folids, fluids, configuration, &c. to be absolutely necessary to exist in many inflances, previous to the system being in a proper situation to become affected with difease: Confequently, it is generally supposed, that perfons who have large heads, short necks, and confiderable irritability of the muscular and nervous systems; likewise those who are of a plethoric diathesis, and have purfued an inactive and fedentary course of life; and who have lived in a luxurious manner, and made too frequent use of intoxicating liquors, are peculiarly predisposed to this melancholy complaint.

FROM the most early knowledge of the human fructure, and of fickness, many difeases have al-

\* Vide Dr. Cullen's first lines of the practice of physic, page 305.

ways been confidered to be of an hereditary nature; until Doctor Brown in his elements of medicine denied their existence altogether :---notwithstanding, he was certainly a man of erudition, and has in my opinion, gone confiderable length in elucidating many parts of medicine; yet I cannot agree with him in this particular, becaufe there does evidently appear a foundation for fuch a diffinction, if we will only reflect on the great fimilitude there frequently is, between parents and their offspring, particularly, as it respects temperament, fabric of body, and peculiarity of mind. But what is more directly in point is, that there are innumerable inflances recorded in the hiftories of physic, by men of the first eminence in their profession, of children becoming affected with difeafes which were peculiar to their anceftors or parents; when no evident external or internal caufe could be fuppofed to have produced them, except hereditary predisposition, and peculiar organization of the folids of the body. out this is not a general party body.

FROM these circumstances, there is I think, great reason to suppose that *apoplexy* might with as much propriety, be ranked under the class of hereditary disorders; as even *fcrophula*, *mania* or the *pulmonary confumption*.

It is an obfervation of medical writers, that this difeafe happens more frequently in the winter feafon, or in fprings which are moderately warm, and have followed fevere and cold winters. There may I think, be fome foundation for fuch an opinion, as it is well known, that the phlogiftic diathefis of the fyftem, at fuch feafons, is more apt

fels at the head : The eyes are in a state of the

to prevail; neverthelefs it may happen and not unfrequently, at every feafon of the year; as experience and obfervation, must convince every phyfician, who is the least conversant in a knowledge of difease.

APOPL FXY like many other complaints comes on oftentimes very fuddenly; but at other times is preceded by certain premonitory fymptoms. The patient falls fuddenly to the ground, and in a great measure, a total and quick privation of all the powers and voluntary motion take place; with coma, and frequently an entire fufpenfion of the energy of the mental faculties : There is fomtimes a lofs of fenfibility and motion on one fide, whilft on the other convulfive action continues .- The mouth is pretty generally thrown open, owing probably to a relaxation of the musels of the lower jaw; and the tongue which is tumefied, is confequently thruft between the teeth; the patient does fomtimes foam at ? the mouth, but this is not a general pathognomonic fign, as it only occurs in fome cafes and but rarely; there is confiderable floridity of the face with a bloated countenance in many inftances; but at other times the reverse happens, and the face is far lefs ruddy, attended with confiderable degree of paleness of the cheeks; the veffels about the cranium, particularly the temples are full and turgid with blood; fo much fo that a hemorrhagy frequently happens from the nafal paffages, mouth, and ears, which may give a temporary relief to the patient; by leffening in fome fmall degree, the too forcible circulation of the blood through the internal and external carotid arteries and their ramifications, alfo making a revulfion from the veffels of the head : The eyes are in a state of tumefaction and pour out an aqueous fluid, they have fometimes a vitreous and fparkling appearance.

A VIOLENT, rapid and forcible palpitation of the heart frequently occurs, with a *pulfe* generally *full*, *ftrong*, *hard* and *flow*; and on other occafions, it is *flow* and very *languid*, though the latter cafe is fuppofed to take place towards the termination of the difeafe.

IN fome inflances (though not generally fpeaking) there is a fpontaneous difcharge from the urinary paffages, with an involuntary evacuation of feces per anum. The refpiration is difficult and laborious to perform, accompanied with *ftertor* or noify refpiration; which may be owing to the *mucus* of the *fauces* being forced through the noftrils; or more probably as Doctor Andrews' obferves in his Inaugural Differtation, "To an ex-" treme degree of relaxation in the palatum molle, " and uvula, in confequence of which they interrupt " the free paffage of air to and from the glottis." The hot and dry fkin which frequently takes place in this diforder, is owing to a diminution of perfpiration in the perfpiratory veffels on the furface of the body.

I SAID formerly that this difeafe was on fome occafions preceded by certain harbingers or precurfory fymptoms; and which are indicative of an immediate approach of an apoplectic paroxyfm. Thefe are of great variety, fuch as, uncommon fluggifhnefs or inactivity of bodily motion; with fome transitory degree of torpidity and diminution of fenfation, in the upper and lower extremities; it is faid that the patients are at times affected with a fenfation of pricking of a peculiar nature, as if infects were crawling over them, it is analogous to the fenfation which takes place in epilepfy; vertigoes or frequent fits of giddinefs, with violent oppreflive pains in the head, and a founding in the ears, known in medical language by the name of *tinnitus aurium*; fome irregularity of vifion and hearing; hemorrhagy from the nares; there is alfo confiderable flownefs of fpeech, or faltering of the tongue in articulating words and fyllables, with an averfion to anfwer queftions put to them by others; a failure of the memory frequently comes on, a great propenfity to drowfinefs, and frequent fits of incubus or the afthma nocturnum.

[9]

FURTHER, a *ftridor dentium* or grinding of the teeth fometimes occurs when the patient is in a ftate of fomnolency, or actual fleep; likewife, a turgefcency of the eyes which are in a ftate of debility, and pour out an aqueous flow of humors; attended with fome flight degree of the imperfection of the organs of vision, happen in fome inftances; oppreffions about the præcordia and organs of refpiration during fleep, pituitous vomiting, and laborious breathing on the leaft degree of motion of the body; tremblings in the greater part of the organs of voluntary motion; it is faid there is an unufual abfence of the hæmorrhoids in thofe perfons who are fubject to attacks of that diforder.

## DIAGNOSIS.

THE diagnostic figns of diseases are in many infances very difficult to comprehend, and sometimes it is utterly impossible to point them out in fo accurate a manner, as to be capable of giving each difeafe its proper generic appellation. For there frequently is fuch a ftrong analogy between different difeafes, in their *caufes*, *fymptoms* and *method* of cure, that one would even fuppofe at first view, that they were one and the fame, though at the fame time, quite opposite in their nature and circumstances: Further, two or more diforders are oftentimes united in the fame patient in fuch a manner, that a physician will be exceedingly embarraffed, in giving a proper and decided diagnosis.

THERE are feveral difeafes taken notice of by practical writers under the denomination of *carus*, *cataphora*, *coma*, *catalepfis* and *lethargus* :—But they appear fo analogous to apoplexy, or to be only different degrees of it, that there would be confiderable difficulty, if not an entire impofibility to draw particular diagnostic figns, between thefe and the one under prefent confideration; therefore, I shall place them, as belonging to the fame head as apoplexy.

INTOXICATON frequently prefents phenomena, fo very analogous to those of the difease of which I am now treating of in this differtation, that they have oftentimes alarmed by-standers exceedingly; and even physicians of experience and observation, if they are not particularly attentive to this circumstance, will frequently be deceived, and have a very inaccurate idea of the real nature and cause of the complaint. Where the phenomena arise from intoxicating liquors, they may generally be discovered by attending particularly to the state of the breath, for it will be so fully faturated with the odorous effluvia of certain fpiritous liquors as brandy, gin, &c. (and which are very commonly uled by perfons who give themfelves up to frequent intoxication;) when this is the cafe, the caufe of the difeafe may with great certainty be pointed out; but on the other hand, when they arife from liquors that do not afford this diftinguifhing characteriftic; fuch as ftrong beer, porter, and many others, then the cafe will be more difficult, and if the phyfician does not apprehend the caufe, from the ftate of the pulfe, as to hardnefs and tenfion, he may continue for feveral hours in doubt and painful anxiety, until the inebriating effects of the liquor go off, and leave the patient in a ftate of indirect debility.

DOCTOR RUSH fays that apoplexy differs from fleep, by coming on fuddenly without any previous fatigue : it also differs materially from the latter, by the great difficulty there is, or indeed an utter impracticability of roufing the patient from his apoplectic paroxyfm. The coma which fucceeds a fit of epilepfy, has a ftriking fimilitude to apoplexy but is faid to be diffinguished from it by paying particular attention to the previous convulsions.

THE narcotic and deleterious effects of many fubftances when taken into the ftomach in large dofes, as opium, belladonna, digitalis and the different preparations of *lead*, &c. produce fymptoms ftrongly refembling those of apoplexy—that it will be difficult to point out the difference with precifion and exact limitation—experience may have fome influence in determining by the peculiar circumftances of the countenance of perfons in this predicament, though they are not eafily defcrib-

C 2

able, the pulle may be another criterion, which is more frequent and not fo full as in apoplexy. Sometimes phenomena fimilar to those of apoplexy have been brought on by overloading the ftomach with food difficult of folution; when this happens it is faid, that the patient exhibits marks of oppreffion and uneafy fenfations of his ftomach, and the pulfe is not fo flow and full as in apoplexy. It will certainly be proper in every cafe of this kind, to free the ftomach from the load and opprefiion; the remedies fuitable for this indication will be large draughts of warm water, gentle emetics, if vomiting cannot be excited by any other means; it will be of the greatest importance to throw out the contents of the ftomach as foon and early as poffible, because they may excite effusions in the brain. Apoplexy is to be diffinguished from palfy, by its being an affection of all the powers of fense and voluntary motion, and from fyncope, by its being with the continuance of the action of the heart, arteries and respiration.

## THE PREDISPONENT CAUSES.

WHATEVER caufes or circumftances occafion a preternatural accumulation of blood in the veffels of the cranium, may with propriety be confidered as predifpoling caufes to apoplexy; therefore I shall attempt to point out fome of those caufes, which commonly produce a plethoric state of the system, and endeavour to explain at the fame time, the manner how they operate as predifpoling caufes, in producing the disease under our prefent confideration.

Ift. Excess in eating and drinking; this of courfe will occasion an increase in the quantity of that fluid which goes to nourish the body, (namely chyle) likewife an augmentation of the general mais of blood in the arterial and venous fyftems; moreover, when the ftomach is diffended with large quantities of animal or vegetable food and drink, the natural confequence refulting from fuch a condition of that organ, is a compression of the different veffels and vifcera of the abdomen, and alfo the midriff or diaphragm will not be capable of performing its important and regular action as before, and of courfe the lungs cannot perform their office with eafe; this being the cafe, there will be an impediment to a confiderable degree to the blood returning in the veins from the head : I think we may juftly infer that this circumftance does take place, if we will only attend particularly to perfons after eating large meals, for their countenances become florid and turgid with blood, the eyes are red, and on fome occafions, there is a degree of fomnolency and flupefaction comes on; from the different effects which are produced by intemperance in eating and drinking, it must at once be evident, that they will produce a very great predifpofition to this complaint.

2d. An indolent life, with a nourifhing and free diet, will have the effect of producing a general phlethoric flate of the fyftem, and in this way does frequently prove a predifpoing caufe of apoplexy.

3d. SUPPRESSION of any cultomary difcharge from the different parts of the body, may be confidered as occasioning a predisposition to this difease, fuch as an evacuation of blood from the hœmorrhoidal veffels conftituting the difeafe called the bleeding piles; likewife bleeding from the nofeafter it has become habitual, is another predifpofing caufe; for in confequence of a ftoppage of this nature, there will be an accumulation of blood in the whole fyftem.

4th. A LARGE head is generally taken notice of by medical writers as another predifpoing caufe to this difeafe, and many of them are of opinion that it occurs more frequently in fuch inftances, than in any other; whether the uncommon largenefs of the head, as fome fuppofe, is only an effect of the predifpoing caufe, and is to be confidered as produced by the determination of the blood, rather than occafioning it, I am not clearly able to determine.

5th. A SHORT neck, is likewife faid to occafion a predifpolition to apoplexy—this is very probable, for the heart muft be much nearer the head than when it is long, the confequence of this will be, the blood muft circulate with confiderable more velocity through the arteries to the cranium; while on the other hand, the return of the blood through the veins will in fome meafure be impeded; owing to the veins being too turgid with that fluid.

6th. CORPULENCY, is mentioned by authors as another predifpofing caufe; and is faid to produce this effect, by compreffing the veffels in every part of the body except the head; if this fhould be the cafe, it must be evident that the blood will accumulate and produce comprefilion of the brain; refpiration becomes laborious to perform, and may occafion an impediment to the free return of the blood from the head.

7th. EXPOSURE of the feet to cold and wet, will prove a predifponent caufe, by producing a feeble circulation, and diminifhing the quantity of blood in the lower extremities, which will be the means of making a greater determination of it to the head.

8th. PAINFUL and long application of the mind to any one fubject, particularly if it fhould be of an abstrufe nature, will frequently occasion a determination of blood to the head; therefore, may prove a predifpoing caufe of apoplexy.

9th. OLD-AGE predifpofes to this complaint by exciting a determination of blood to the head, from particular and accidental caufes, not eafy to point out on all occafions.

#### THE EXCITING CAUSES.

THESE are fuch powers as when applied either generally or partially to the human body, are capable of exciting a paroxyfm of apoplexy, particularly in those perfons who have a ftrong predifposition to become affected with this melancholy difease. Their operation is either to increase the momentum or velocity of blood in its circulation through the vessels of the head; or on the other hand, to fuddenly augment the blood in the vessels of the brain. They are of confiderable number, therefore I shall mention fome of them. Ift. VIOLENT exercife, may be confidered as a very common exciting caufe, and produces its effects by increasing the impetus of blood in the general circulation.

2nd. WHEN the general application of heat is applied to the body, it is very probable that its action muft operate in an analogous manner, as the one we have just previoufly mentioned.

3rd. WHEN heat has been partially applied to the head, as when a perfon is exposed to the direct rays of the fun, it will frequently excite apoplexy.

4th. Excess of venery will on fome occasions excite a paroxylm.

5th. IT is faid that the ftriking in of any eruptions, or fuddenly drying up iffues, fetons, &c. will prove exciting caufes.

6th. MERCURIAL falivations carried too a great length.

7th. FRACTURES and contufions of the head, and poifonous exhalations, are also caufes which will produce apoplexy.

8th. VIOLENT passions of the mind, as anger, grief, exceffive joy, &c. these appear to occasion particularly a determination of blood to the head, as is evident from the floridity of the countenance which takes place.

10th. STOOPING too long with the head down, or laying with it in too low a polition, will occasion in many inflances an augmentation of blood in the veffels of the head, by hindering its return freely from the brain.

[ 17 ]

11th. ANY violent exertion, which is fuddenly brought on may be confidered as another exciting caufe; the manner in which this effect is produced is by occafioning a long infpiration in breathing; the confequence of which will be, the blood muft be retarded in its paffage through the lungs from the right fide of the heart, and of courfe will interrupt the return of blood from the head: this is alfo difcovered by the appearance of the countenance.

12th. FLEXION and twifting of the neck, ligatures drawn very tight round the neck, tumors, &c. all occasion apoplexy, these act by compressing the internal jugular veins, and obstructing the blood through them.

13th. EXTREME intoxication, food difficult of digeftion in the flomach; Doctor Rufh fays he knew an inftance in Philadelphia of an apoplexy being brought on by a perfon fupping on toafted cheefe.

14th. BREATHING the contaminated air in a crowded affembly will frequently excite a fit of apoplexy.

15th. NARCOTIC substances have sometimes the fame effect in producing this diforder.

16th. VOMITING is faid to be a powerful exciting caufe. In this cafe, the contents of the vifcera of the abdomen are compressed in a violent manner, the diaphragm and abdominal muscles are brought into a state of convulsion, the consequence of which will be, that the blood in the ascending vena

D

THUS fome fuppole that apopleyy depends encava must be fent with much more velocity to the right auricle and ventricle of the heart; wherefore, obstructing the free discharge of blood in the descending cava, there will also be some degree of compression of the descending aorta; and thereby must occasion a much greater determination of blood to the head ; from the circumstance of vomiting respiration becomes obstructed, and the blood which paffes through the right ventricle of the heart, is impeded and cannot be difcharged into the pulmonic veffels; therefore, the venal blood returning from the head will be obstructed: though there is at the fame time a confiderable quantity fent to the head by the larger arteries, and apoplexy is brought on by a rupture and extravalation of blood in fome of the veffels of the brain.

### PROXIMATE CAUSE.

THE proximate caufe of difeafes has always engaged the particular attention of phylicians of the greatest eminence, ever fince the most early knowledge of the human body and its difeafes : therefore, there have been (as one might naturally fuppole) a variety of opinions and theories on the fubject; many however, appear to have been merely hypothetical and vifionary; and it is certainly at this prefent time, a part of the science of medicine, which is exceedingly intricate to comprehend in an accurate and fatisfactory manner. There have been at different periods of time, feveral theories advanced to account for the proximate caufe of the difeafe we are at prefent confidering; but most of them appear to me not well founded in fact.

THUS fome fuppofe that apoplexy depends entirely on fthenic diathefis, while on the other hand it is afferted to depend on an affhenic diathefis of the fyftem; and Doctor Hoffman in his practice of phyfic, fuppofes that this difeafe is always owing to hæmorrhagy of the veffels, confequently he gives the fame proximate caufe to it, as to hæmorrhagy in every other part of the body. Doctor Cullen, in his firft lines of the Practice of Phyfic, fuppofes the proximate caufe to be whatever interrupts the motion of the nervous power from the brain to the mufcles of voluntary motion, or whatever has a tendency to deftroy the mobility of the nervous power from the fentient extremities of the nerves to the brain.

[ 19 ]

THE opinion of Doctor Rufh on this fubject, appears to me very plaufible. He obferves in his clinical lectures, that the proximate caufe of apoplexy, is a *defect* or *excefs* of irregular action in the veffels of the brain. This idea perfectly correfponds with the theory the Doctor has laid down refpecting the division of the difeafe, into *tcnic* and *atonic* flates. Therefore, I fhall adopt this theory of the proximate caufe of apoplexy, becaufe it appears as confonant to juft reafon and found philofophy, as any which has been advanced on the fubject.

### bradandico of PROGNOSIS.

in an accentato an

A PHYSICIAN fhould always be very much on his guard, in giving a decided opinion respecting the favorable termination of this difease; because, in many inflances, the causes which occafion an attack of an apoplectic paroxyfm are fo powerful, and the difeafe runs its courfe with fuch great rapidity, that animal life is very foon extinguifhed; notwithftanding, the moft efficacious remedies have been adminiftred with vigilance and circumfpection: but at other times a phyfician may be more fafe and juftifiable in giving a prognofis if he will always be particularly attentive to pay refpect, (and which will be of the greateft importance to him) to a confideration of the patient's time of life, vigor of conflitution, and cuftomary habits; likewife, to the nature of the fymptoms, continuance of the difeafe, and its peculiar predifpofing and exciting caufes.

CONSEQUENTLY, if the coma and other attending fymptoms are in a flight degree, and the flrength of the fyftem not confiderably exhaufted; there may be fome reafonable hopes of a recovery; but on the contrary, if all of thefe fymptoms increafe in force, and continue violent any length of time, as for feveral days, the difeafe will most generally terminate in the diffolution of the patient's life; or proceed into fome other complaint : and it is faid that before death, the pulfe, which from the first attack had been full and flow, now begins to become quick and frequent in its pulfations.

It has been a commonly received opinion that a patient cannot furvive a third attack of a fit of apoplexy; though this opinion certainly appears to be fallacious and is without any juft or reafonable foundation; as it appears very evident that it must depend entirely on the violence and duration of the paroxyfms, and not on any fanciful or particular number. As the patient's fenses become confiderably diminifhed, fo in proportion, will the danger of death be apprehended. When the pulfe becomes very flow or very frequent, it is obferved to be an unfavorable fign, and when the pulfe is irregular and very feeble, it portends that death is faft approaching, and will foon clofe the tragic fcene.

WHENEVER the fphincter muscle of the anus, and alfo of the bladder, become much relaxed, and loofe their power of action, in the first onfet of the fit, there will be great reafon to apprehend that it will terminate in the death of the patient, as it is an unfavourable fymptom. Sometimes the patient loofes entirely all power of deglutition ; when this happens the danger is very confiderable, as it indicates a difeafe of great violence and feverity; when a cold and clammy fweat comes out on the furface of the body, with a cadaverous or deadly appearance of the countenance, floridity and dulnefs of the eyes, the prognofis must be unfavorable, as a recovery is fcarcely, if ever to be expected; on the contrary, when the difeafe comes on in confequence of a fudden ceffation of any cuftomary evacuation, and if this should return again fpontaneoully, or by the means of artificial meafures, accompanied with a gentle and equable perfpiration over the whole furface of the body; there may still be fome hopes of a falutary termination of the paroxyfm; it is mentioned that a copious and free discharge of urine, containing a fediment; alfo, fpontaneous evacuations from the inteftinal canal; likewife, fpontaneous vomiting, have all of them been the means of bringing on a refolution of the difeafe.

# METHODOFCURE.

WE come now to a part of our fubject, which is of the utmost confequence to be attended to, by every phyfician, who values the life and health, of his patient; becaufe, the difeafe frequently proves fuddenly fatal, notwithstanding immediate affistance has been reforted to and the most powerful remedies have been administered without delay, but all in vain; and the phyfician has to ftand oftentimes an humble and compaffionate fpectator, feeing his patient expire in the agonies of death, without being able to afford any affiftance :- what is of further confequence and importance is, that whenever a perfon has once been attacked with this direful malady, however flight it might have been, he will hardly ever enjoy fo good a fhare of health, and vigor of conftitution as before, and will always be very liable to a return of another paroxyfm.

THIS will of courfe lead us to divide the cure into two diffinct part. The first is to employ remedies during the continuance of the dilease; and the fecond is, after the complaint is removed, to administer those remedies which will be proper and fuitable to prevent a relapse.

THE remedies for the first indication are, 1st. Bleeding. It is of the greatest importance to bleed in this difease, as much so, as in any inflammatory complaint whatever, not even pneumonia and phrenitis excepted.

DRAWING of blood from the occipital and frontal veins, or temporal arteries as has been recommended by different authors, must frequently prove inconvenient and troublesome; therefore, should on most occasions be laid entirely as ide, particularly, as it can be obtained from another source, with more ease and equal advantage.

OPENING the carotid arteries and jugular veins has been recommended, but as this operation may fometimes be attended with ferious confequences to the patient, it fhould never, in my opinion be put in practice, except in fome very urgent cafes indeed.

CONSEQUENTLY, bleeding in one arm or both arms has been fubflituted in their place by most practitioners, and with great propriety.

THE quantity of blood neceffary to be drawn, muft always be in proportion to the fulnefs of the pulfe and condition of the fyftem; but on moft occafions, it will be abfolutely proper and urgent to bleed immediately and copioufly, as foon as a perfon has been attacked, for by this mean, it will leffen exceffive action in the arterial and venous fyftems, and obviate to a confiderable degree indirect debility, and therefore prevent in a great meafure effufions taking place in the brain; when it arifes from falls or violent contufions, bood-letting fhould always be very copious, excepting there was great predifpofing debility before, to contraindicate fo liberal a ufe of it.

WHEN blood-letting has been employed in as fufficient quantities as the patient's ftrength will admit of, and the violence of the fymptoms continue; cupping on the temples and fcarifying on the back part of the head, may be practifed with advantage; as thefe means, may obviate the fymptoms without increasing the debility of the fystem in fo great a degree.

2nd. PURCES. Thefe are of the greateft importance, and if any power of fwallowing remain, draftic purgatives fhould be preferred, given by the mouth, but if deglutition is not capable of being performed, then acrid glyfters mult be administered: although, purgatives have been objected to by fome, yet experience and obfervation, appear to warrant their ufefulnefs. They produce their good effects by evacuating the contents of the inteftines, and making a revultion from the head; it is fuppofed this organ is generally relieved in proportion to the quantity difcharged.

3rd. COLD water will leffen excess of action in the veffels of the brain, and when poured on the head, may prove a very powerful and ufeful remedy in the cure of apoplexy.

4th. IT will be abfolutely neceffary that the patient fhould be placed in an erect pofture, fo that the blood may flow as eafily as poffible from the head; all ligatures fhould be removed from the neck and different parts of the body.

WHEN a patient has been in a paroxyfm three or four hours, before affiftance is obtained, then the above remedies may not be fo proper or ufeful; becaufe the fyftem muft have run into fuch a ftate of indirect debility, that they would not anfwer the proper indication; therefore recourfe muft be had to remedies of a more powerful and ftimulating nature. The following will be found proper and fometimes very efficacious.

T 25 1

Ift. BLISTERS applied to the whole head. It will be neceffary that the head fhould be fhaved fometime before their application.

and. THE actual cautery applied to the head.

3rd. ACRID fimulating cataplaims of muftard and flour applied to the palms of the hands, and foles of the feet, have proved very beneficial, in roufing the patient.

4th. FRICTIONS and electricity are excellent flimulants, and will be found very ferviceable.

5th. COOL and pure air is of the greatest importance in this difease; therefore all perfons should be turned out of the room immediately, except those who are absolutely necessary to attend on the patient; for they phlogisticate the air, and render it unfit for the purposes of respiration: cool air may in some degree diminish the action of the heart and arteries, and prove useful also in that way.

THE remedies for the fecond indication. It will be of confiderable importance to pay particular attention to thofe means, which may have a tendency to prevent a return of an apoplectic paroxyfm; particularly, as this difeafe is very much difpofed to return, after a perfon has once been attacked with it; and the repeated attacks of it almost always fooner or later terminate in the death of the patient. When it terminates in death, it is gen-

E

erally preceded by *womiting*, cold fweats, and convultions: fometimes it runs into an hemiplegia or paraplegia: when this happens, there is pretty generally a lofs of the internal fenfes, as of the memory accompanied with fatuity &c. and it does fometimes happen, that it terminates in perfect health; but this is not a frequent occurrence.

AND as the difease may depend on two different ftates of action in the fystem, either *tonic* or *atonic*; the method of preventing the fits, must be regulated according as one or other of these fhould happen to prevail; as well as a due attention likewife to the predisponent and exciting causes.

THEREFORE all those perfons who are of a full and plethoric habit of body, fhould pay particular attention to fobriety in eating and drinking; they thould attend allo firicitly to the quantity and quality of their aliment, and fhould always be careful to avoid overloading their flomachs with food at any time, but at fupper it fhould be particularly abitained from altogether. Those who have habituated themfelves to eating fupper, it might be improper for them to leave it off all at once; therefore, their food either animal or vegetable, fhould be in fmall quantities, light and of eafy digeftion.

IF the patient has been accuftomed to drink wine or other fpirituous liquors of any kind, he fhould not abitain from them immediately; but muft use them with great moderation, and it may not be improper to dilute them with water. *Wine* being lighter and much lefs nutritious, than either *beer*, *porter* or indeed any *malt liquor* whatever; will certainly be moft preferable and will not be fo liable to produce plethora of the fyftem; running, jumping, &c. or violent exercife of any kind, fhould be particularly avoided by every perfon, who is the leaft predifpoted, or has had an attack of this diforder.

EXERCISE is of very great advantage in this difeafe, as it will when united with a proper regimen, obviate in a confiderable degree plethora of the fyftem; it ought to be of fuch a kind as may fupport the perfpiration, without increasing the heat of the body, or hurrying refpiration; therefore, *riding* and *walking* will be found the most proper and useful of any.

PERSONS who are not fubject to frequent fits of giddinefs, and who have habituated themfelves to riding on horfeback, fhould continue in the practice of using it, as this mode of exercise is preferable to all others: when however giddinefs does take place, then bodily exercise may be employed with beneficial effects; though it will be highly proper and neceffary to pay particular attention to the restrictions which I just now mentioned; but in men who are very far advanced in years, and also men of corpulent habits of body, the exercise of walking ought always to be in a moderate degree, and frequently repeated.

VIOLENT paffions of the mind which are fuddenly brought on, fhould by all means be carefully avoided, as anger, fear, exceffive joy, &c. as they would prove of the most mischievous confequences to the patient.

WHEN fymptoms do occur of a plethoric state

in the veffels of the head, a feton or pea-iffue applied in the nape of the neck, may prove uleful, by obviating any turgefcence of blood there.

WHERE there is a tendency to a plethora in the veffels of the head, or it does actually exift, gentle laxatives may be administered with propriety, as they will in fome measure prevent a turgescence in those parts.

It will be highly important, to guard particularly against all the exciting causes, as they will have a very great influence in bringing on a relapse; such as passions of the mind; anxiety of mind, intense application to fludy, too tight ligatures about the neck; exposure of the feet to cold and wet, &c. and if a person has been habituated to have a discharge from the nose, hæmorrhidal vessels, or any other part of the system, and there should be a cessariation of them all of a fudden, he ought by every possible means in his power to bring back again the customary evacuation. If this cannot be accomplished, recourse must be had to an artificial discharge by a feton or iffue, which must be perpetually kept open.

ANY cuftoms and habits, which the patient has been long accuftomed to, fhould not be changed immediately, but in a gradual manner; further, all thofe who are of a delicate and weakly habit of conflictution, and have at the fame time, fymptoms of plethora and turgefcence in the veffels of the head, fhould pay ftrict attention to temperance in eating and drinking, and in every other refpect endeavour to avoid, as much as poffible, thole caufes which may increase the general circulation of blood in the arterial and venous systems; and they ought to use moderate exercise, and every other gentle tonic which might have a tendency to reflore vigor and strength to the body. Sometimes the premonitory symptoms which I formerly mentioned on another occasion do occur, although remedies have been employed to prevent them; when this happens to take place, the most proper method to be purfued is *blood letting*, *mild purgatives* and *vegetable diet*.

THE phenomena which have appeared on diffecting those who have fallen victims to this infidious difeafe, are effusions of red blood, sometimes a quantity of fluid analogous to ferum, and on fome rare occasions an effusion of pus; a diftention frequently of the plexus choriodes, and bodies fomething fimilar to hydatids in other parts of the body have been found conjoined with them, containing blood and ferum; large tumors; and the brain is fometimes more flaccid and fofter than in a natural state. There is usually a diftention of the arteries and veins with blood, and an extravafation of blood or ferum is almost on all occasions found between the cranium and dura mater, the dura and pia mater or in the ventricles of the brain; and the elaborate diffections of the learned Morgagni, have fhown that effusions of blood have taken place in every part within the cranium.

HAVING brought this differtation to a conclusion, I have only to bid a cordial and an affectionate farewell to this rifing university. That she may long continue to be the grand forum for the promotion of medical fcience in the United States of America; and fend forth her fons, eminent for fcientific knowledge and moral rectitude. Thather medical profeffors may ever continue to be the patrons and promoters of the healing art and walk through the fcenes of human life unrivalled, and be a perpetual ornament in the annals of mankind, is my most ardent and fincere wifh.

## FINIS.
